Topics (1)

- Introduction to Java Programming
- Installation and configuration
- IDE
- Basic of Java Programming
- Mistake from Java programmer
- Write automated tests with JUnit
- SOLID :: How to design testable application

Topics (2)

- Introduction to Spring Boot
- Create starter project
- Structure of project
- Develop RESTful APIs
- Working with Database with JPA
- Testing with Spring Boot

Java Programming

TIOBE Index 2025

| Sep 2025 | Sep 2024 | Change | Programming Language | Ratings | Change |
|----------|----------|---|--|---------|--------|
| 1 | 1 | |  Python | 25.90% | +5.61% |
| 2 | 2 | |  C++ | 8.80% | -1.94% |
| 3 | 4 |  |  C | 8.65% | -0.24% |
| 4 | 3 |  |  Java | 8.35% | -1.09% |
| 5 | 5 | |  C# | 6.38% | +0.30% |
| 6 | 6 | |  JavaScript | 3.22% | -0.70% |
| 7 | 7 | |  Visual Basic | 2.84% | +0.14% |
| 8 | 8 | |  Go | 2.32% | -0.03% |
| 9 | 11 |  |  Delphi/Object Pascal | 2.26% | +0.49% |
| 10 | 27 |  |  Perl | 2.03% | +1.33% |
| 11 | 9 |  |  SQL | 1.66% | -0.08% |

Multi-
threading

Software Requirements

Java Development Kit
IntelliJ IDEA (community edition)

Download JDK 17/21/25

Java 25, Java 21, and earlier versions available now

JDK 25 is the latest *Long-Term Support (LTS)* release of the Java SE Platform.

[Learn about Java](#)

JDK 21 is the previous Long-Term Support (LTS) release of the Java SE Platform.

Earlier JDK versions are available below.

[JDK 25](#) [JDK 21](#)

Java SE Development Kit 25 downloads

JDK 25 binaries are free to use in production and free to redistribute, at no cost, under the [Oracle No-Fee Terms and Conditions \(NFTC\)](#).

JDK 25 will receive updates under the NFTC, until September 2028, a year after the release of the next LTS. Subsequent JDK 25 updates will be [available on Oracle Technology Network \(OTN\)](#) and production use beyond the [limited free grants](#) of the OTN license will [require a fee](#).

Java 25

History of Java from 8 to 25

<https://www.infoq.com/news/2025/09/java25-released/>

Evolution of Java language

| Version | Year | # of classes/interfaces | New features |
|---------|------|-------------------------|---|
| 5 | 2004 | 3,279 | Generic class, for-each, varargs, annotation, static import, enum |
| 7 | 2011 | 4,024 | Switch with string |
| 8 | 2014 | 4,240 | Lambda expression, interface with default method, Stream API |
| 9 | 2017 | 6,005 | Module |
| 11 | 2018 | 4,410 | Local variable type inference (var) |
| 17 | 2021 | 4,396 | Switch expression, text block, record |
| 21 | 2023 | 4,443 | Virtual thread, pattern matching |
| 25 | 2025 | 4,695 | Compact compilation unit, foreign function |

Config JAVA_HOME and PATH

```
set JAVA_HOME=<path of JDK>
set PATH=.;%JAVA_HOME%\bin;%PATH%
```

Testing configuration

```
$javac -version  
$java -version
```

Download IntelliJ IDEA

We're committed to giving back to our wonderful community, which is why IntelliJ IDEA Community Edition is completely free to use

Introduction to Java

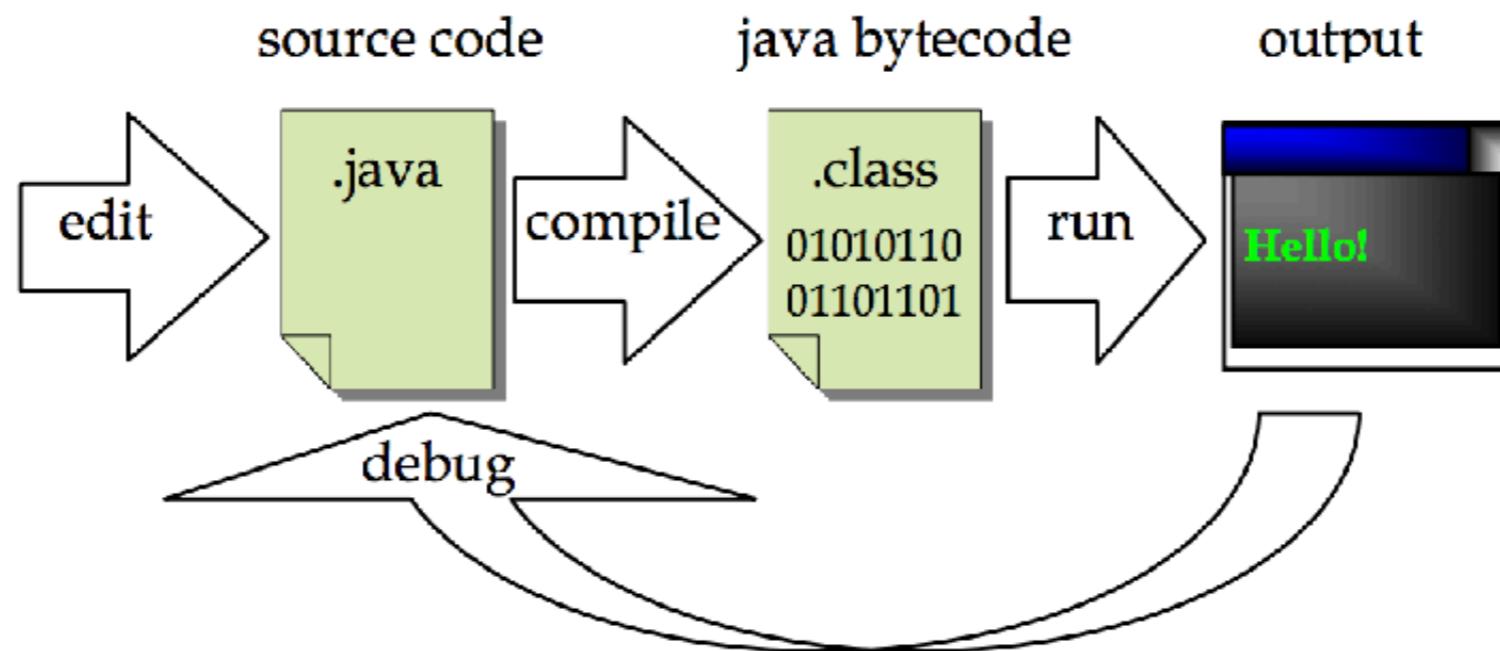

Structure of Java program

Create file HelloWorld.java

```
1 public class HelloWorld {  
2  
3     // Show message in a console  
4     public static void main(String[] args) {  
5         System.out.println("Hello World");  
6     }  
7 }  
8  
9 }
```

Compile and Run program

```
$javac HelloWorld.java
```

```
$java HelloWorld
```

Hello World

Keywords

| | | | | |
|----------|----------|------------|-----------|--------------|
| abstract | continue | for | new | switch |
| assert | default | goto | package | synchronized |
| boolean | do | if | private | this |
| break | double | implements | protected | throw |
| byte | else | import | public | throws |
| case | enum | instanceof | return | transient |
| catch | extends | int | short | try |
| char | final | interface | static | void |
| class | finally | long | strictfp | volatile |
| const | float | native | super | while |

https://docs.oracle.com/javase/tutorial/java/nutsandbolts/_keywords.html

Comments

Documentation comment

Single line comment (C++ style)

Multi-line comment (C style)

Comments

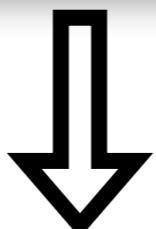

```
1 /**
2  * 1. Documentation comment
3  *
4  * @author somkiat
5 */
6 public class HelloWorld {
7
8     // 2. Single line comment (C++ style)
9 public static void main(String[] args) {
10    /*
11        3. Multi-line comment (C style)
12    */
13    System.out.println("Hello World");
14
15 }
16
17 }
```

Formatting/ Readability

Whitespace characters in program are ignored during the compilation

```
1 public class HelloWorld {  
2     public static void main(String[] args) {  
3         System.out.println("Hello World");  
4     }  
5 }
```

```
1 public class HelloWorld {  
2     public static void main(String[] args) {  
3         System.out.println("Hello World");  
4     }  
5 }
```

Any fool can write code that
a computer can understand.
Good programmers write
code that humans can
understand.

Martin Fowler

QuoteAddicts.com

Java Code convention

Oracle (1997)

<https://goo.gl/pfPc1S>

Google

<https://github.com/google/styleguide>

<https://google.github.io/styleguide/javaguide.html>

Spring Framework

<https://github.com/spring-projects/spring-framework/wiki/Code-Style>

<https://github.com/47deg/coding-guidelines/tree/master/java/spring>

Basic of Java

Basic of Java Part 1

Variables name
Expressions
Statements
Data types
Operators

Variables and assign value

Symbolic names of memory location

A variable must have name and data type (static type)

Must be declared before using it

```
int number;  
int counter = 1;  
String name;  
double averageScore = 3.5;
```

Naming rule for Java identifier

Can't be a Java keyword

Case-sensitive

Unlimited length of Unicode letters and digits

Must begin with a letter, underscore(_) and dollar sign (\$)

White space not allowed

White space ?

Such as spacebar

isWhitespace

```
public static boolean isWhitespace(char ch)
```

Determines if the specified character is white space according to Java. A character is a Java whitespace if:

- It is a Unicode space character (SPACE_SEPARATOR, LINE_SEPARATOR, or PARAGRAPH_SEPARATOR) ('\u0020' through '\u002F').
- It is '\t', U+0009 HORIZONTAL TABULATION.
- It is '\n', U+000A LINE FEED.
- It is '\u000B', U+000B VERTICAL TABULATION.
- It is '\f', U+000C FORM FEED.
- It is '\r', U+000D CARRIAGE RETURN.
- It is '\u001C', U+001C FILE SEPARATOR.
- It is '\u001D', U+001D GROUP SEPARATOR.
- It is '\u001E', U+001E RECORD SEPARATOR.
- It is '\u001F', U+001F UNIT SEPARATOR.

<https://docs.oracle.com/javase/8/docs/api/java/lang/Character.html#isWhitespace-char->

Naming convention

Use meaningful name

For compound words use **camelCase**

Class name begin with an **Uppercase** letter

Variable and **method** name begin with a **Lowercase** letter

For a **constant** use **all uppercase letter** and
underscore(_) to separate word

Meaningful name

```
int d = 10;  
int days = 10;  
int daysSinceCreation = 10;  
int daysSinceLastModification = 10;
```

Expressions

Expression is a value, variable, method or one of their combination that can be evaluated to a value

3.14

a + b

a + c -10

a > 10

Math.sqrt(4)

“Hi, all”

(a + 3 > b) && (a - 3 < c)

Statements

Complete sentence that causes some action to occur
End with semicolon (;

```
int a;  
int b = 10;  
c = a + b;  
boolean isPass = a > b;  
System.out.println("Hello");
```

Data types (Statically typed)

1. Primitive data types
2. Classes

1. Primitive data types

Basic of Java data types have 8 types
Can't add and change

| Value type | Primitive data types |
|-----------------------------------|------------------------|
| Integer (-10, 10, 0) | byte, short, int, long |
| Floating-point (1.0, -1.5, 3.144) | float, double |
| Character ('a', 'ñ') | char |
| Logical (true, false) | boolean |

<https://docs.oracle.com/javase/tutorial/java/nutsandbolts/datatypes.html>

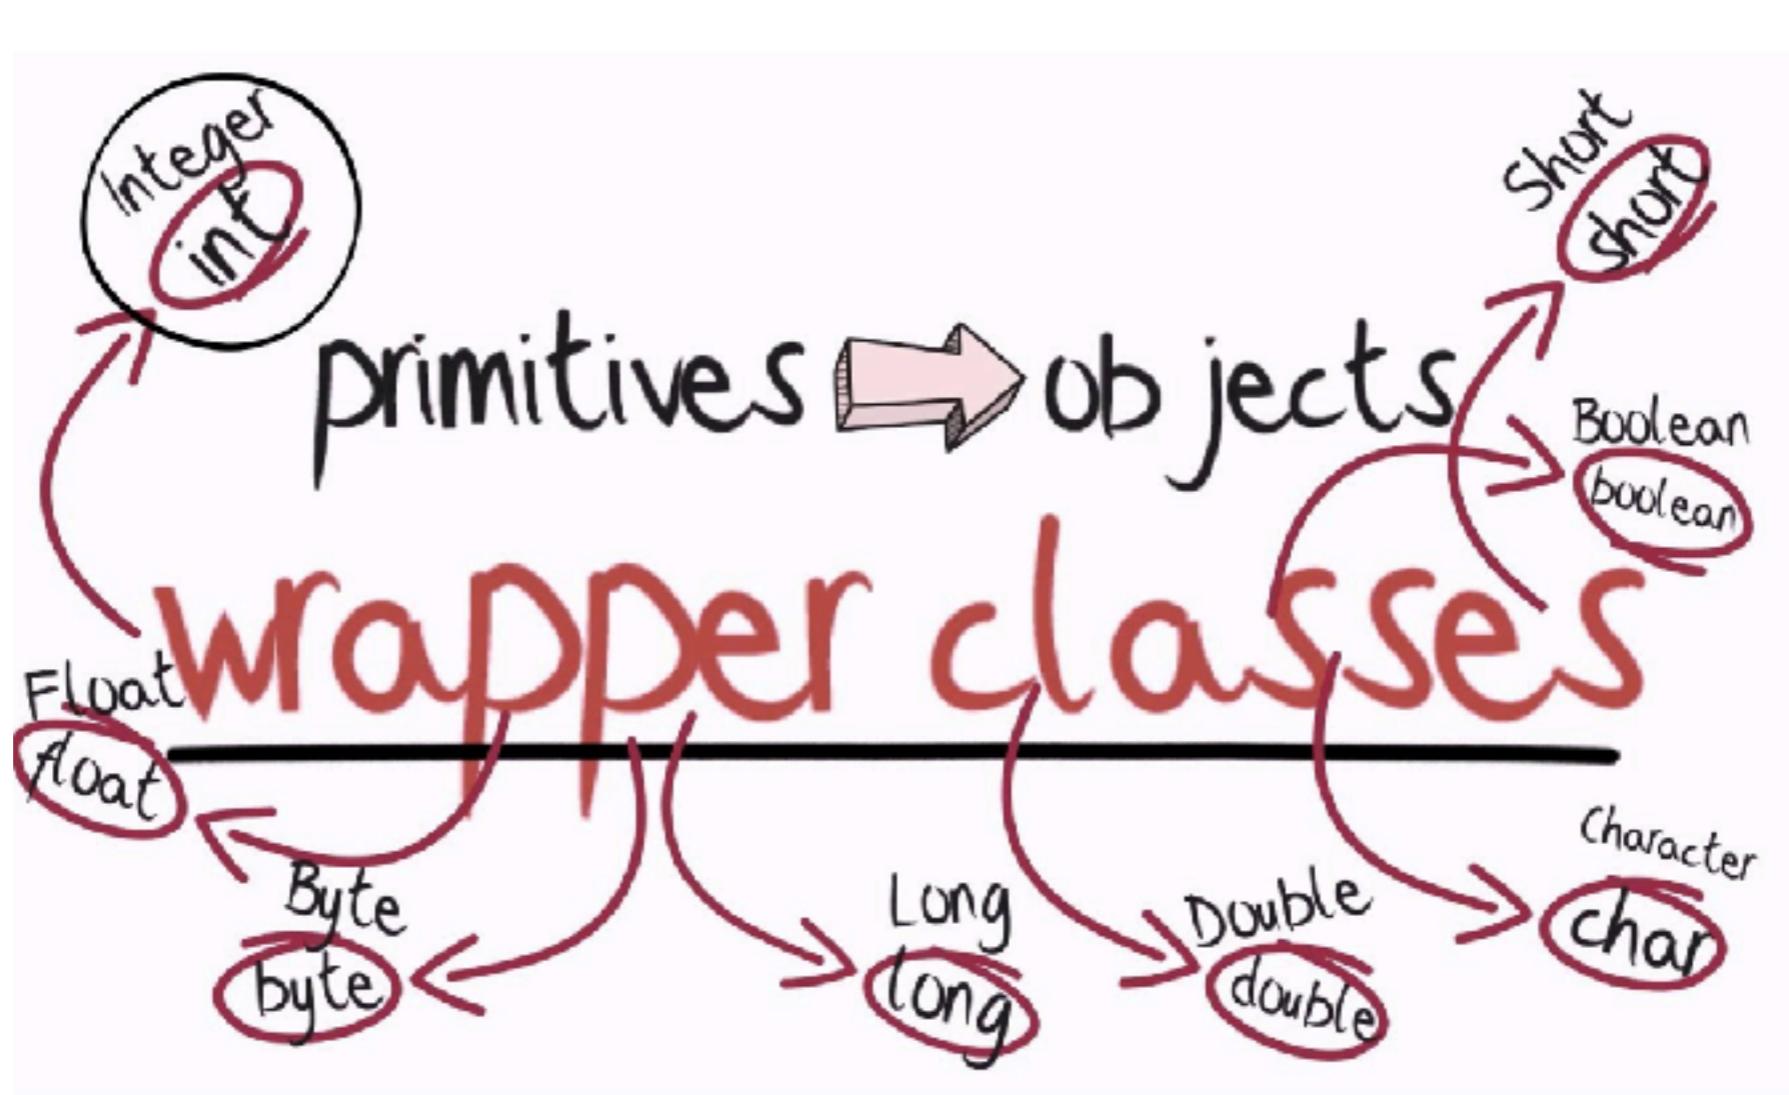

Primitive data types

| Primitive data types | | Min/Max value |
|----------------------|--------------------------------------|--|
| byte | 8-bit signed two complement integer | -128 / 127 |
| short | 16-bit signed two complement integer | -32,768 / 32,767 |
| int | 32-bit signed two complement integer | -2 ³¹ / 2 ³¹ - 1 |
| long | 64-bit signed two complement integer | -2 ⁶³ / 2 ⁶³ - 1 |
| float | 32-bit IEEE 754 floating point | |
| double | 64-bit IEEE 754 floating point | |
| boolean | | true, false |
| char | 16-bit Unicode character | \u0000 / \uffff |

Wrapper class

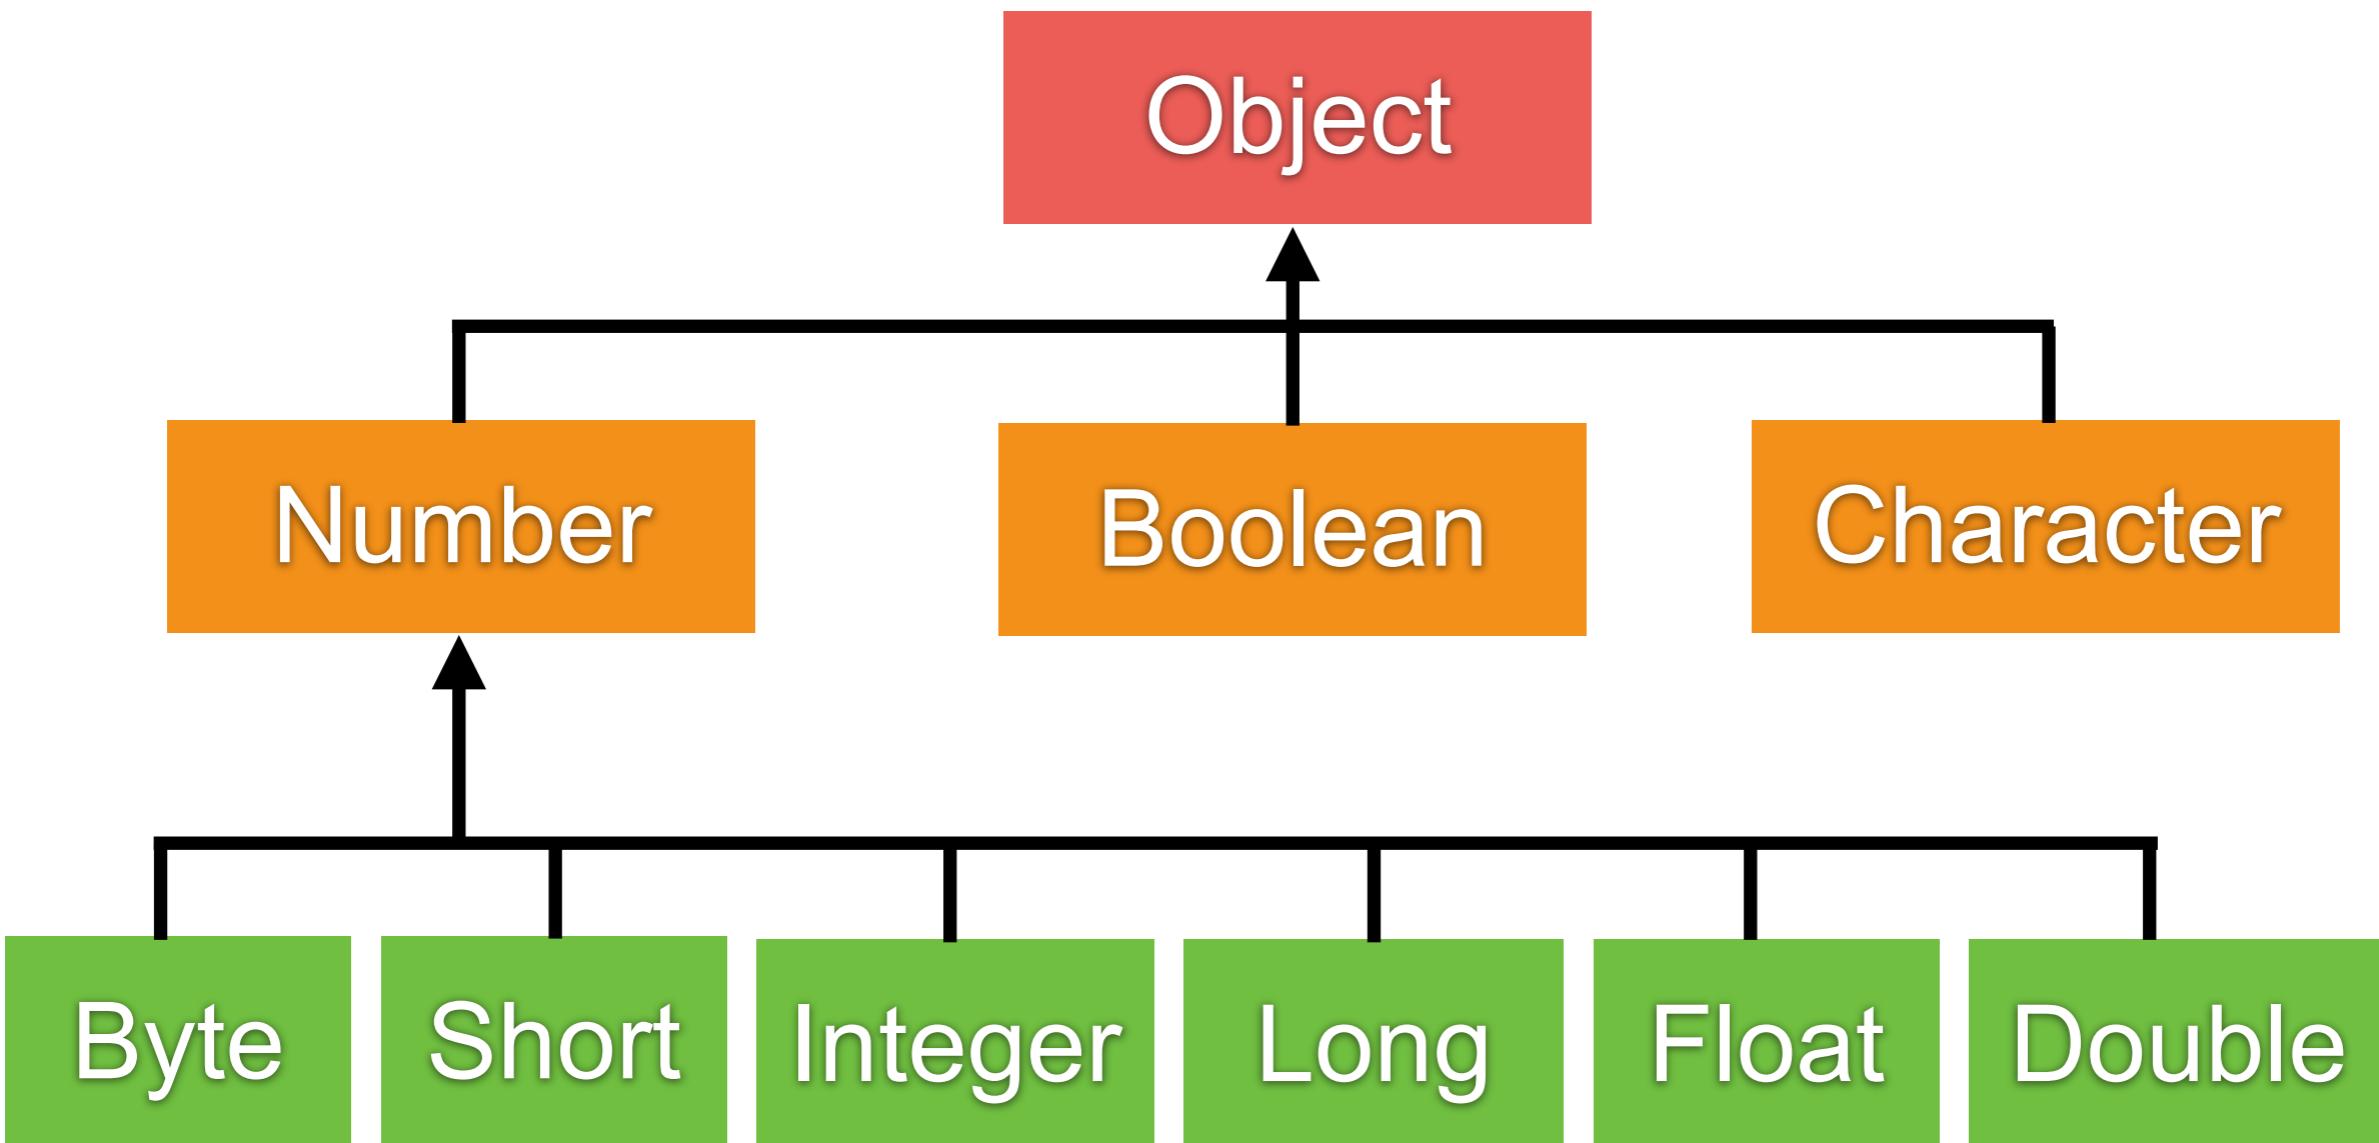

Wrapper class

| Primitive data types | Wrapper class |
|----------------------|---------------|
| byte | Byte |
| short | Short |
| int | Integer |
| long | Long |
| float | Float |
| double | Double |
| boolean | Boolean |
| char | Character |

Wrapper class hierarchy

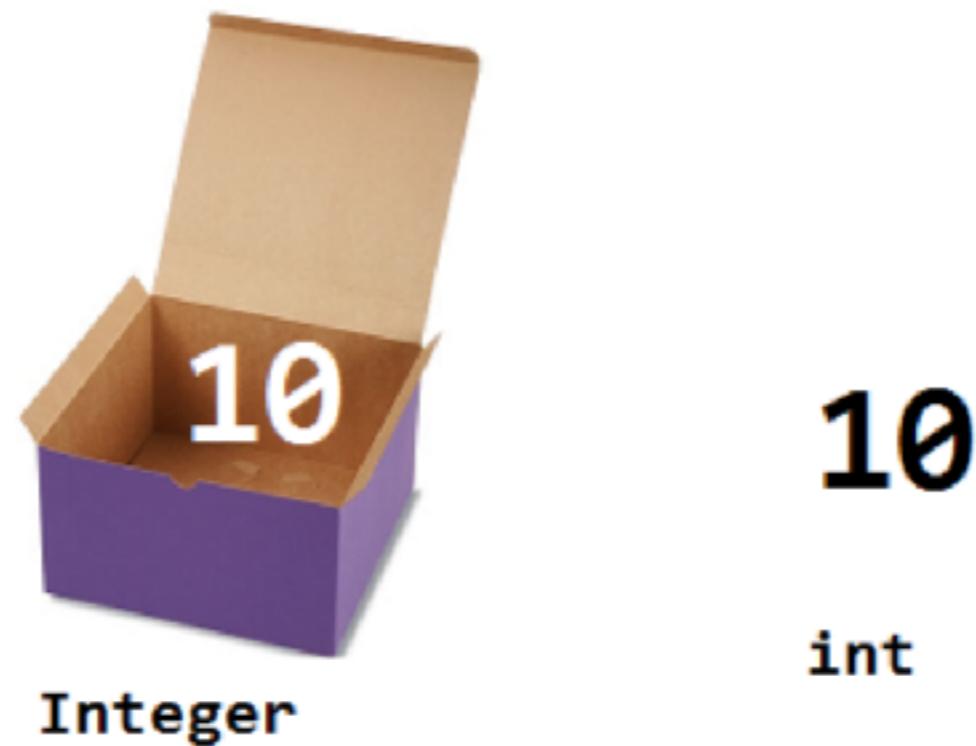

Min/Max value of primitive type

| Primitive data types | Minimum value | Maximum value |
|----------------------|---------------------|---------------------|
| byte | Byte.MIN_VALUE | Byte.MAX_VALUE |
| short | Short.MIN_VALUE | Short.MAX_VALUE |
| int | Integer.MIN_VALUE | Integer.MAX_VALUE |
| long | Long.MIN_VALUE | Long.MAX_VALUE |
| float | Float.MIN_VALUE | Float.MAX_VALUE |
| double | Double.MIN_VALUE | Double.MAX_VALUE |
| char | Character.MIN_VALUE | Character.MAX_VALUE |

Working with wrapper class (1)

Working with wrapper class (2)

```
// Wrapping
int number = 10;
Integer number2 = new Integer(number);
Integer number3 = Integer.valueOf(number);

// Unwrapping
int valueBack2 = number2.intValue();
int valueBack3 = number3.intValue();
System.out.println(valueBack2);
System.out.println(valueBack3);
```

Wrapper class conversion

Autoboxing and Autounboxing

```
// Autoboxing  
int number = 10;  
Integer number2 = number;
```

```
// Autounboxing  
int valueBack2 = number2;  
System.out.println(valueBack2);
```

Final variables

Can't change the value of variables (immutable)

Use keyword **final**

```
// Constant variable
private static final int NUMBER_ONE = 1;

private void init() {
    // Final variable
    final int number = 10;
    number = 200; // Can't modify value
}
```

Functions !!

Write small functions

Name them properly

Hide implementation details

Document immediately

Tests

2. Classes

Complex data types

Classes are **standard** from Java such as String,
Integer

We can create new classes as we need

Working with String

Not primitive data type

Standard class in Java

Represent a sequence of one or more characters

```
String shortName = "S";  
String name = "Somkiat Puisungngoen";
```

<https://docs.oracle.com/javase/8/docs/api/java/lang/String.html>

Working with String operation

```
String name = "Somkiat";
System.out.println(name.concat(" Pui"));
System.out.println(name.substring(1, 2));
System.out.println(name.charAt(0));
System.out.println(name.startsWith("S"));
System.out.println(name.endsWith("t"));
```

Operators

Operators that require 2 operands are called
Binary operator

Operators that require only 1 operand are called
Unary operator

Parentheses, () are called **Grouping operator**

Operators

Arithmetic operators

 Unary operators

Equality and Relational operators

 Conditional operators

Bitwise and bit shift operators

Arithmetic operators

| Operator | Description |
|----------|---|
| + | Addition operator (can use for String concatenation) |
| - | Subtraction operator |
| * | Multiplication operator |
| / | Division operator |
| % | Remainder operator |

String with additional operator

```
String firstName = "Somkiat";
String lastname = "Puisungnoen";
int age = 30;
```

```
String result = firstName + lastname + age;
```

```
System.out.println(result);
```

Formatting result

```
String firstName = "Somkiat";
String lastname = "Puisungnoen";
int age = 30;
```

```
System.out.printf("%s %s %d"
    , firstName, lastname, age);
```

Formatting result with String

```
String firstName = "Somkiat";
String lastname = "Puisungnoen";
int age = 30;
```

```
String result = String.format("%s %s %d",
    firstName, lastname, age);
```

```
System.out.println(result);
```

Unary operators

Required only one operand

| Operator | Description |
|----------|-----------------------------|
| + | Unary plus operator |
| - | Unary minus operator |
| ++ | Increment operator |
| -- | Decrement operator |
| ! | Logical complement operator |

Equality and relational operator

| Operator | Description |
|--------------------|--------------------------|
| <code>==</code> | Equal to |
| <code>!=</code> | Not equal to |
| <code>></code> | Greater than |
| <code>>=</code> | Greater than or equal to |
| <code><</code> | Less than |
| <code><=</code> | Less than or equal to |

Conditional operator

| Operator | Description |
|----------|--|
| && | Conditional-AND |
| | Conditional-OR |
| ?: | Ternary (shorthand for if-then-else statement) |

Type comparison with instanceof

```
String object1 = new String();
```

```
System.out.println(object1 instanceof String);  
System.out.println(object1 instanceof Object);
```

Bitwise and bit shift operator

| Operator | Description |
|----------|-------------------------------|
| & | Bitwise AND operator |
| | Bitwise inclusive OR operator |
| ^ | Bitwise exclusive OR operator |
| ~ | Unary bitwise complement |
| >> | Signed left shift |
| << | Signed right shift |
| >>> | Unsigned right shift |

Useful methods from Math (1)

| Method | Description |
|---------|--|
| abs() | returns the absolute value of the input value |
| round() | returns the integer nearest to the input value |
| ceil() | returns the smallest integer that is bigger than or equal to the input value |
| floor() | returns the biggest integer that is smaller than or equal to the input value |
| exp() | returns the exponential of the input value |
| max() | returns the bigger between the two input values |
| min() | returns the smaller between the two input values |

<https://docs.oracle.com/javase/8/docs/api/java/lang/Math.html>

Useful methods from Math (2)

| Method | Description |
|--------|---|
| pow() | returns the value of the first value raised to the power of the second value. |
| sqrt() | returns the square root of the input value. |
| sin() | returns the trigonometric sine value of the input value |
| cos() | returns the trigonometric cosine value of the input value. |
| tan() | returns the trigonometric tangent value of the input value. |

<https://docs.oracle.com/javase/8/docs/api/java/lang/Math.html>

Workshop with Math

The distance, d , between two points in the three-dimensional space (x_1, y_1, z_1) and (x_2, y_2, z_2) can be computed from:

$$d = \sqrt{(x_1 - x_2)^2 + (y_1 - y_2)^2 + (z_1 - z_2)^2}$$

The following program computes and shows the distance between $(2, 1, 3)$ and $(0, 0, 6)$

Compound assignment

| Original | Shorthand |
|------------------------|---------------------|
| <code>x = x + 1</code> | <code>x += 1</code> |
| <code>x = x - 1</code> | <code>x -= 1</code> |
| <code>x = x * 1</code> | <code>x *= 1</code> |
| <code>x = x / 1</code> | <code>x /= 1</code> |

Caution for complex expression

| Original | Shorthand |
|-----------------|-------------------------|
| $x = x / y + 1$ | $x /= y + 1$ (Wrong !!) |
| $x = x / y + 1$ | $x /= (y + 1)$ |

Operator precedence (1)

| No. | Operator | Precedence |
|-----|----------------|------------------------------------|
| 1 | Grouping | () |
| 2 | Postfix | expr++, expr-- |
| 3 | Unary/Prefix | ++expr, --expr, +expr, -expr, ~, ! |
| 4 | Multiplicative | *, /, % |
| 5 | Addtitive | +, - |
| 6 | Shift | >>, <<, >>> |
| 7 | Relational | <, >, <=, >=, instance |

<https://docs.oracle.com/javase/tutorial/java/nutsandbolts/operators.html>

Operator precedence (2)

| No. | Operator | Precedence |
|-----|----------------------|--|
| 8 | Equality | <code>==, !=</code> |
| 9 | Bitwise AND | <code>&</code> |
| 10 | Bitwise exclusive OR | <code>^</code> |
| 11 | Bitwise inclusive OR | <code> </code> |
| 12 | Logical AND | <code>&&</code> |
| 13 | Logical OR | <code> </code> |
| 14 | Ternary | <code>?:</code> |
| 15 | Assignment | <code>=, +=, <<=, >>= ...</code> |

Increment/Decrement operator

Prefix

the value inside the variable is incremented (or decremented) and then use to evaluate the expression

Postfix

the value inside the variable is used to evaluate the expression and then the value is incremented (or decremented)

Workshop

```
int a, b, c = 0;  
a = c++;  
b = ++a;  
c++;  
b = ++c + a++;  
a = --b + c++;
```

| a | b | c |
|---|---|---|
| 0 | 0 | 0 |
| | | |
| | | |
| | | |
| | | |
| | | |

```
System.out.println(a); // ?  
System.out.println(b); // ?  
System.out.println(c); // ?
```

Basic of Java Part 2

Basic of Java Part 2

Control flow statements

Conditional statements (if-else/switch case)

For loop

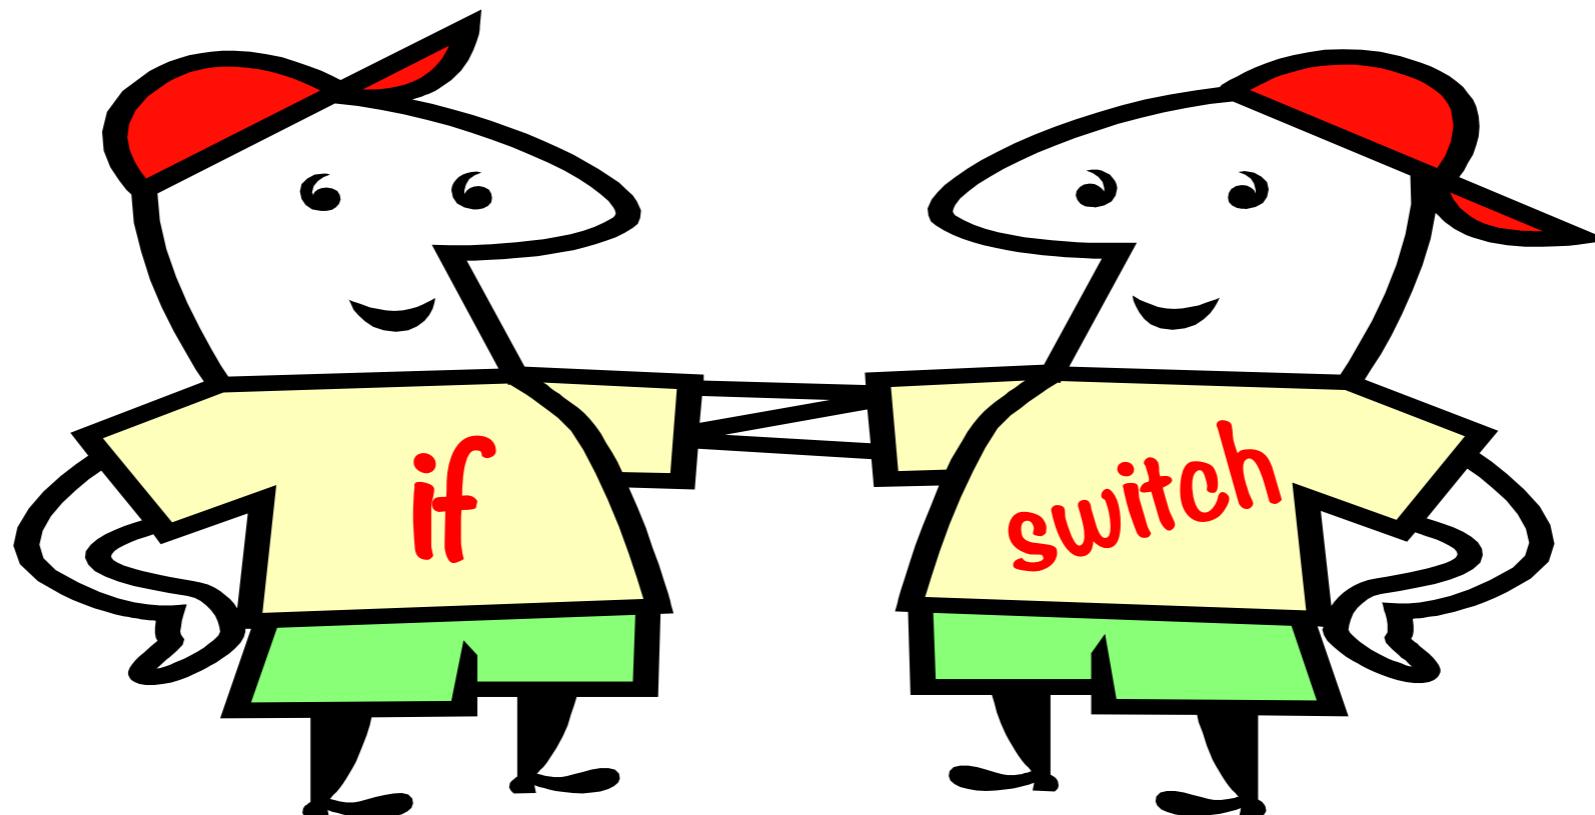

While loop

Do-while loop

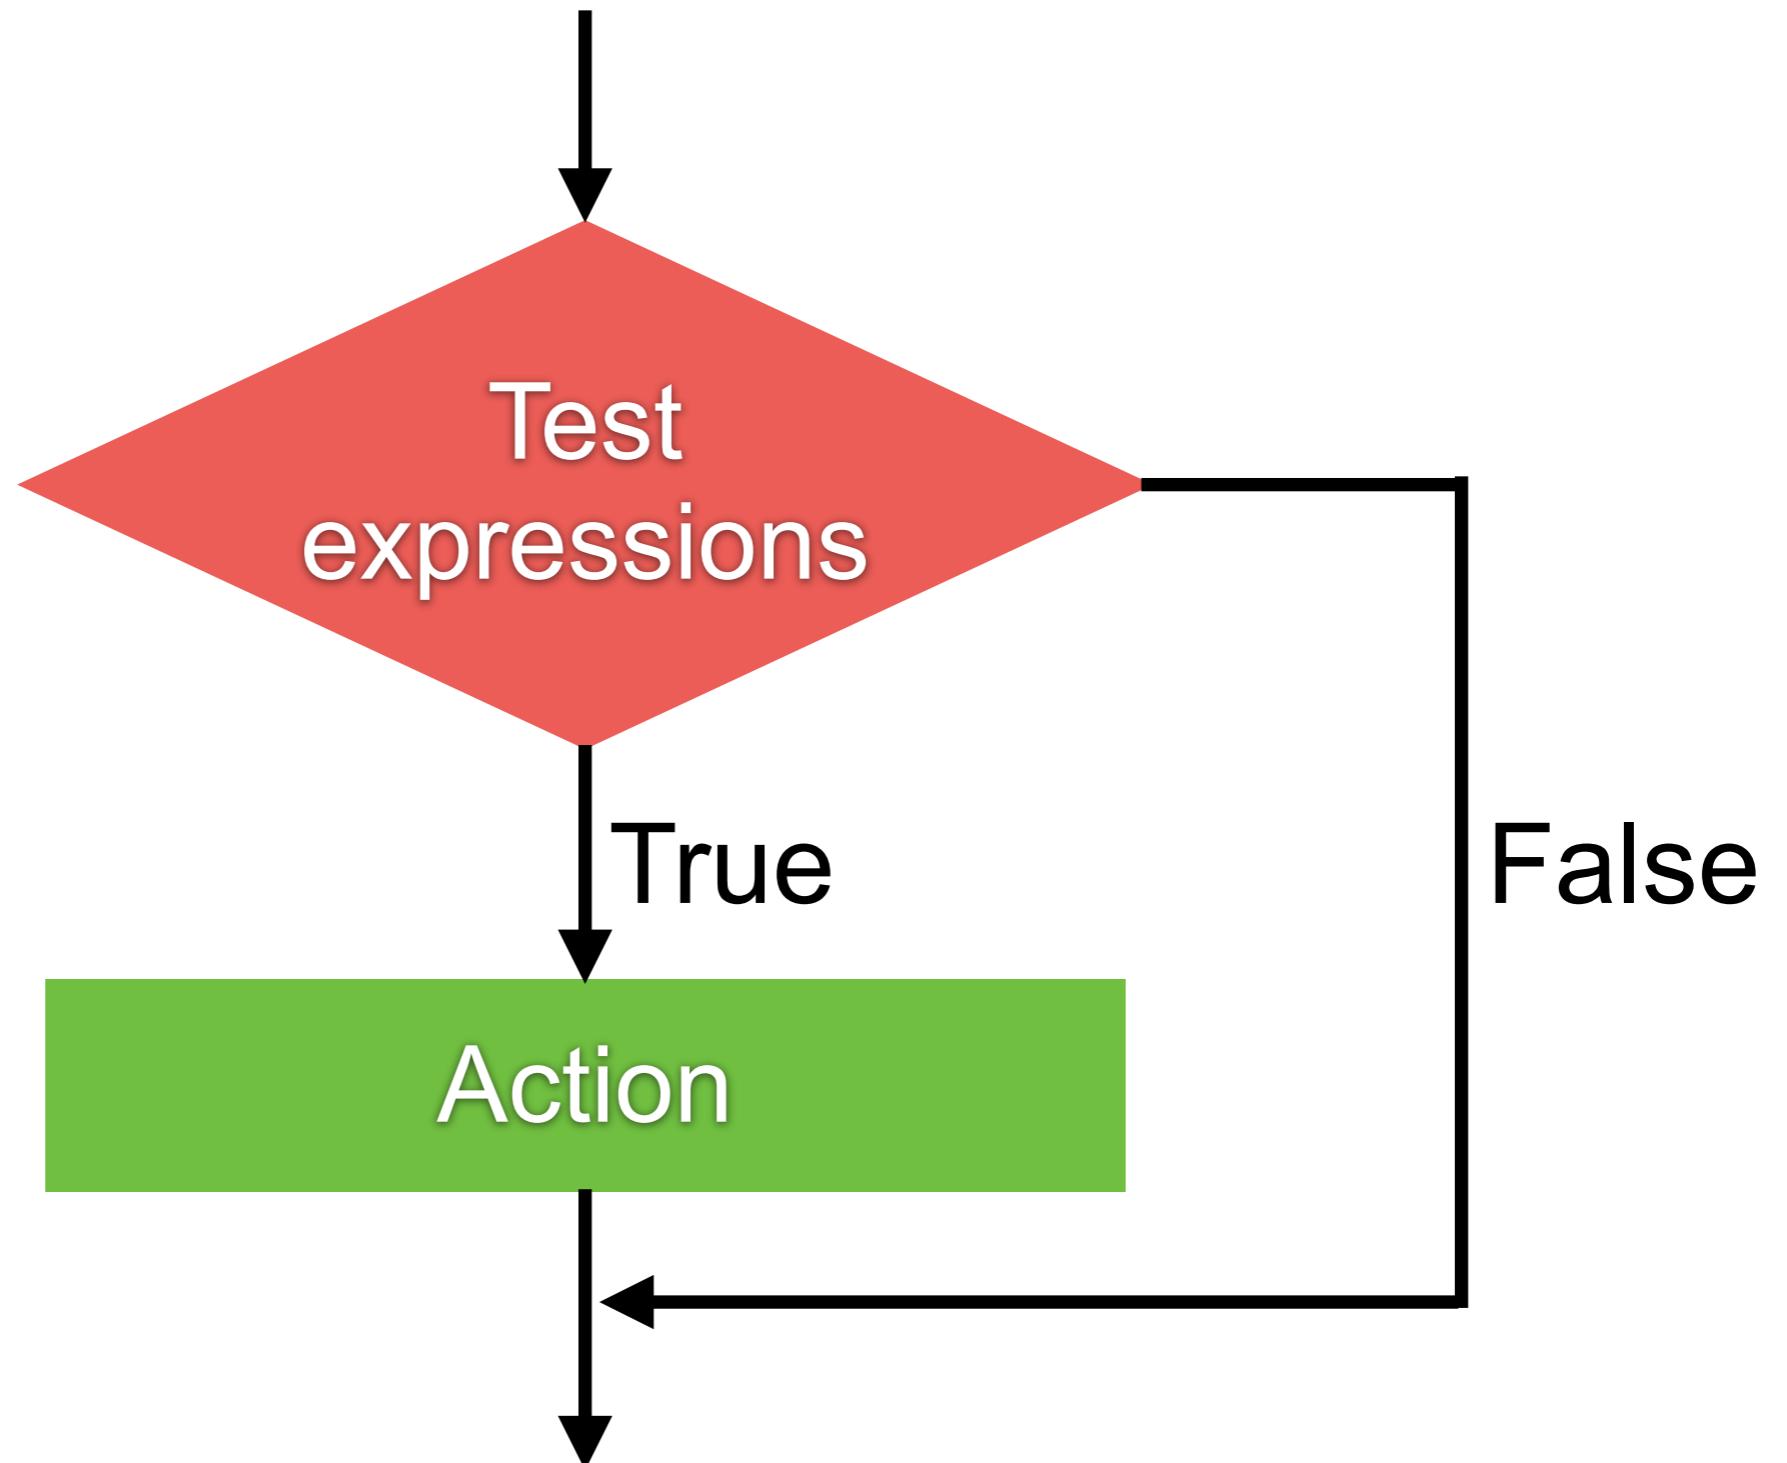

Conditional statements

if-else if - else
switch-case

IF - ELSE IF - ELSE

IF - ELSE IF - ELSE

```
int score = 50;

if (score >= 80 && score <= 100) {
    System.out.println("Grade A");
} else if (score >= 70 && score < 80) {
    System.out.println("Grade B");
} else if (score >= 60 && score < 70) {
    System.out.println("Grade C");
} else if (score >= 50 && score < 60) {
    System.out.println("Grade D");
} else {
    System.out.println("Grade F");
}
```

Ternary operator (short if)

```
int score = 50;
```

```
String grade = score > 80 ? "A" : score > 70 ? "B" : "C";
```

```
System.out.println(grade);
```

Easy to read and understand ?

Workshop

String comparison

String comparison (1)

```
String name1 = new String("Somkiat");
String name2 = new String("Somkiat");

if(name1 == name2) {
    System.out.println("Equal");
} else {
    System.out.println("Not equal");
}
```

String comparison (2)

```
String name1 = new String("Somkiat");
String name2 = new String("Somkiat");

if(name1.equals(name2)) {
    System.out.println("Equal");
} else {
    System.out.println("Not equal");
}
```

String Equality

String comparison (3)

```
String name1 = "Somkiat";
String name2 = "Somkiat";

if(name1 == name2) {
    System.out.println("Equal");
} else {
    System.out.println("Not equal");
}
```

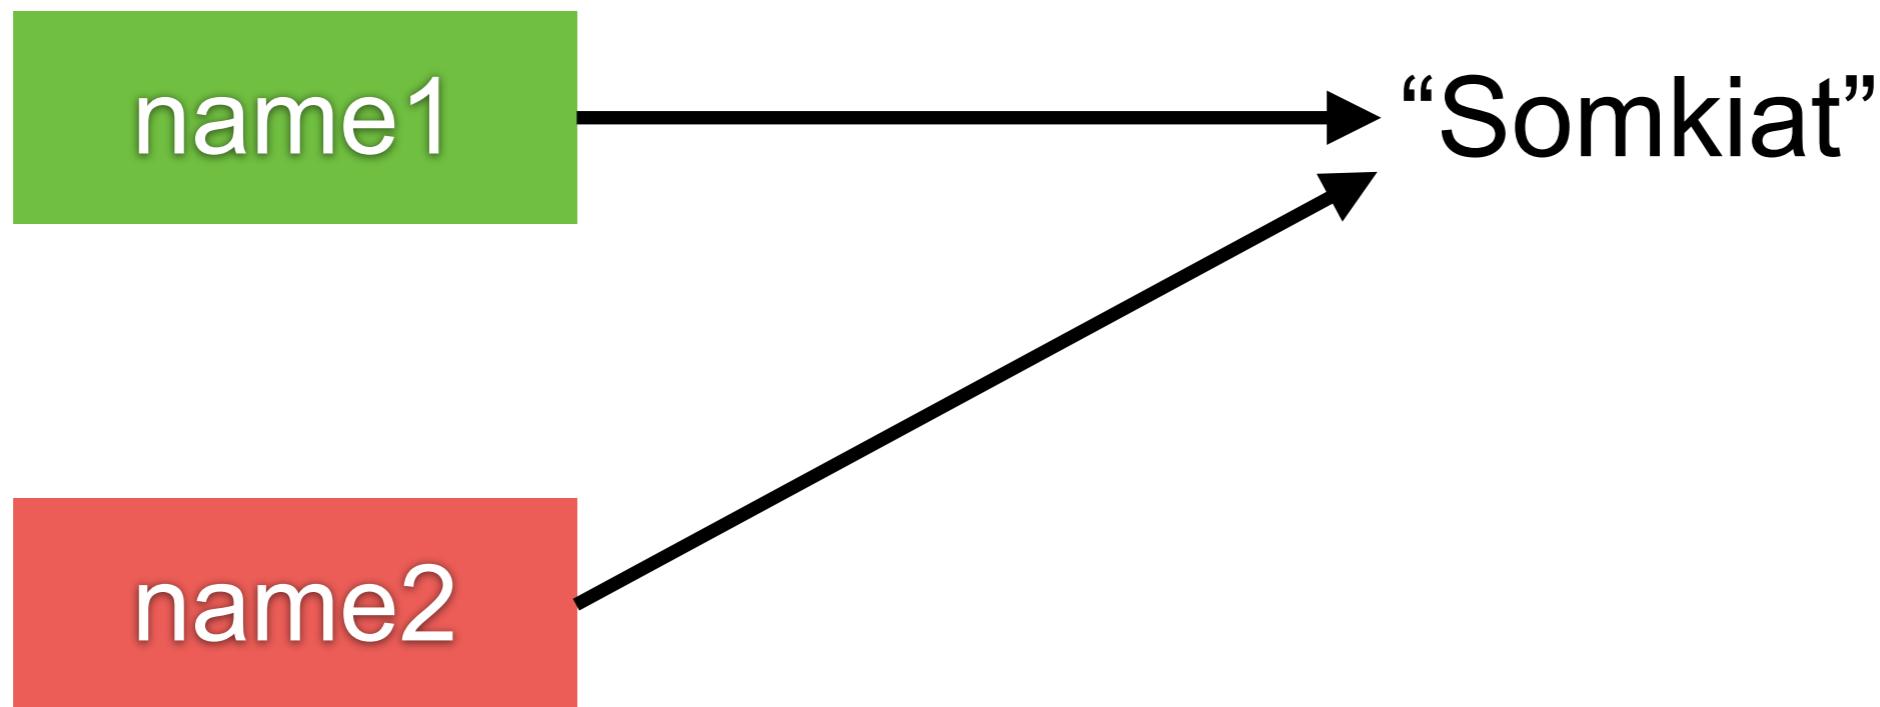

String comparison (4)

```
String name1 = "Somkiat";
String name2 = "Somkiat";

if(name1.equals(name2)) {
    System.out.println("Equal");
} else {
    System.out.println("Not equal");
}
```

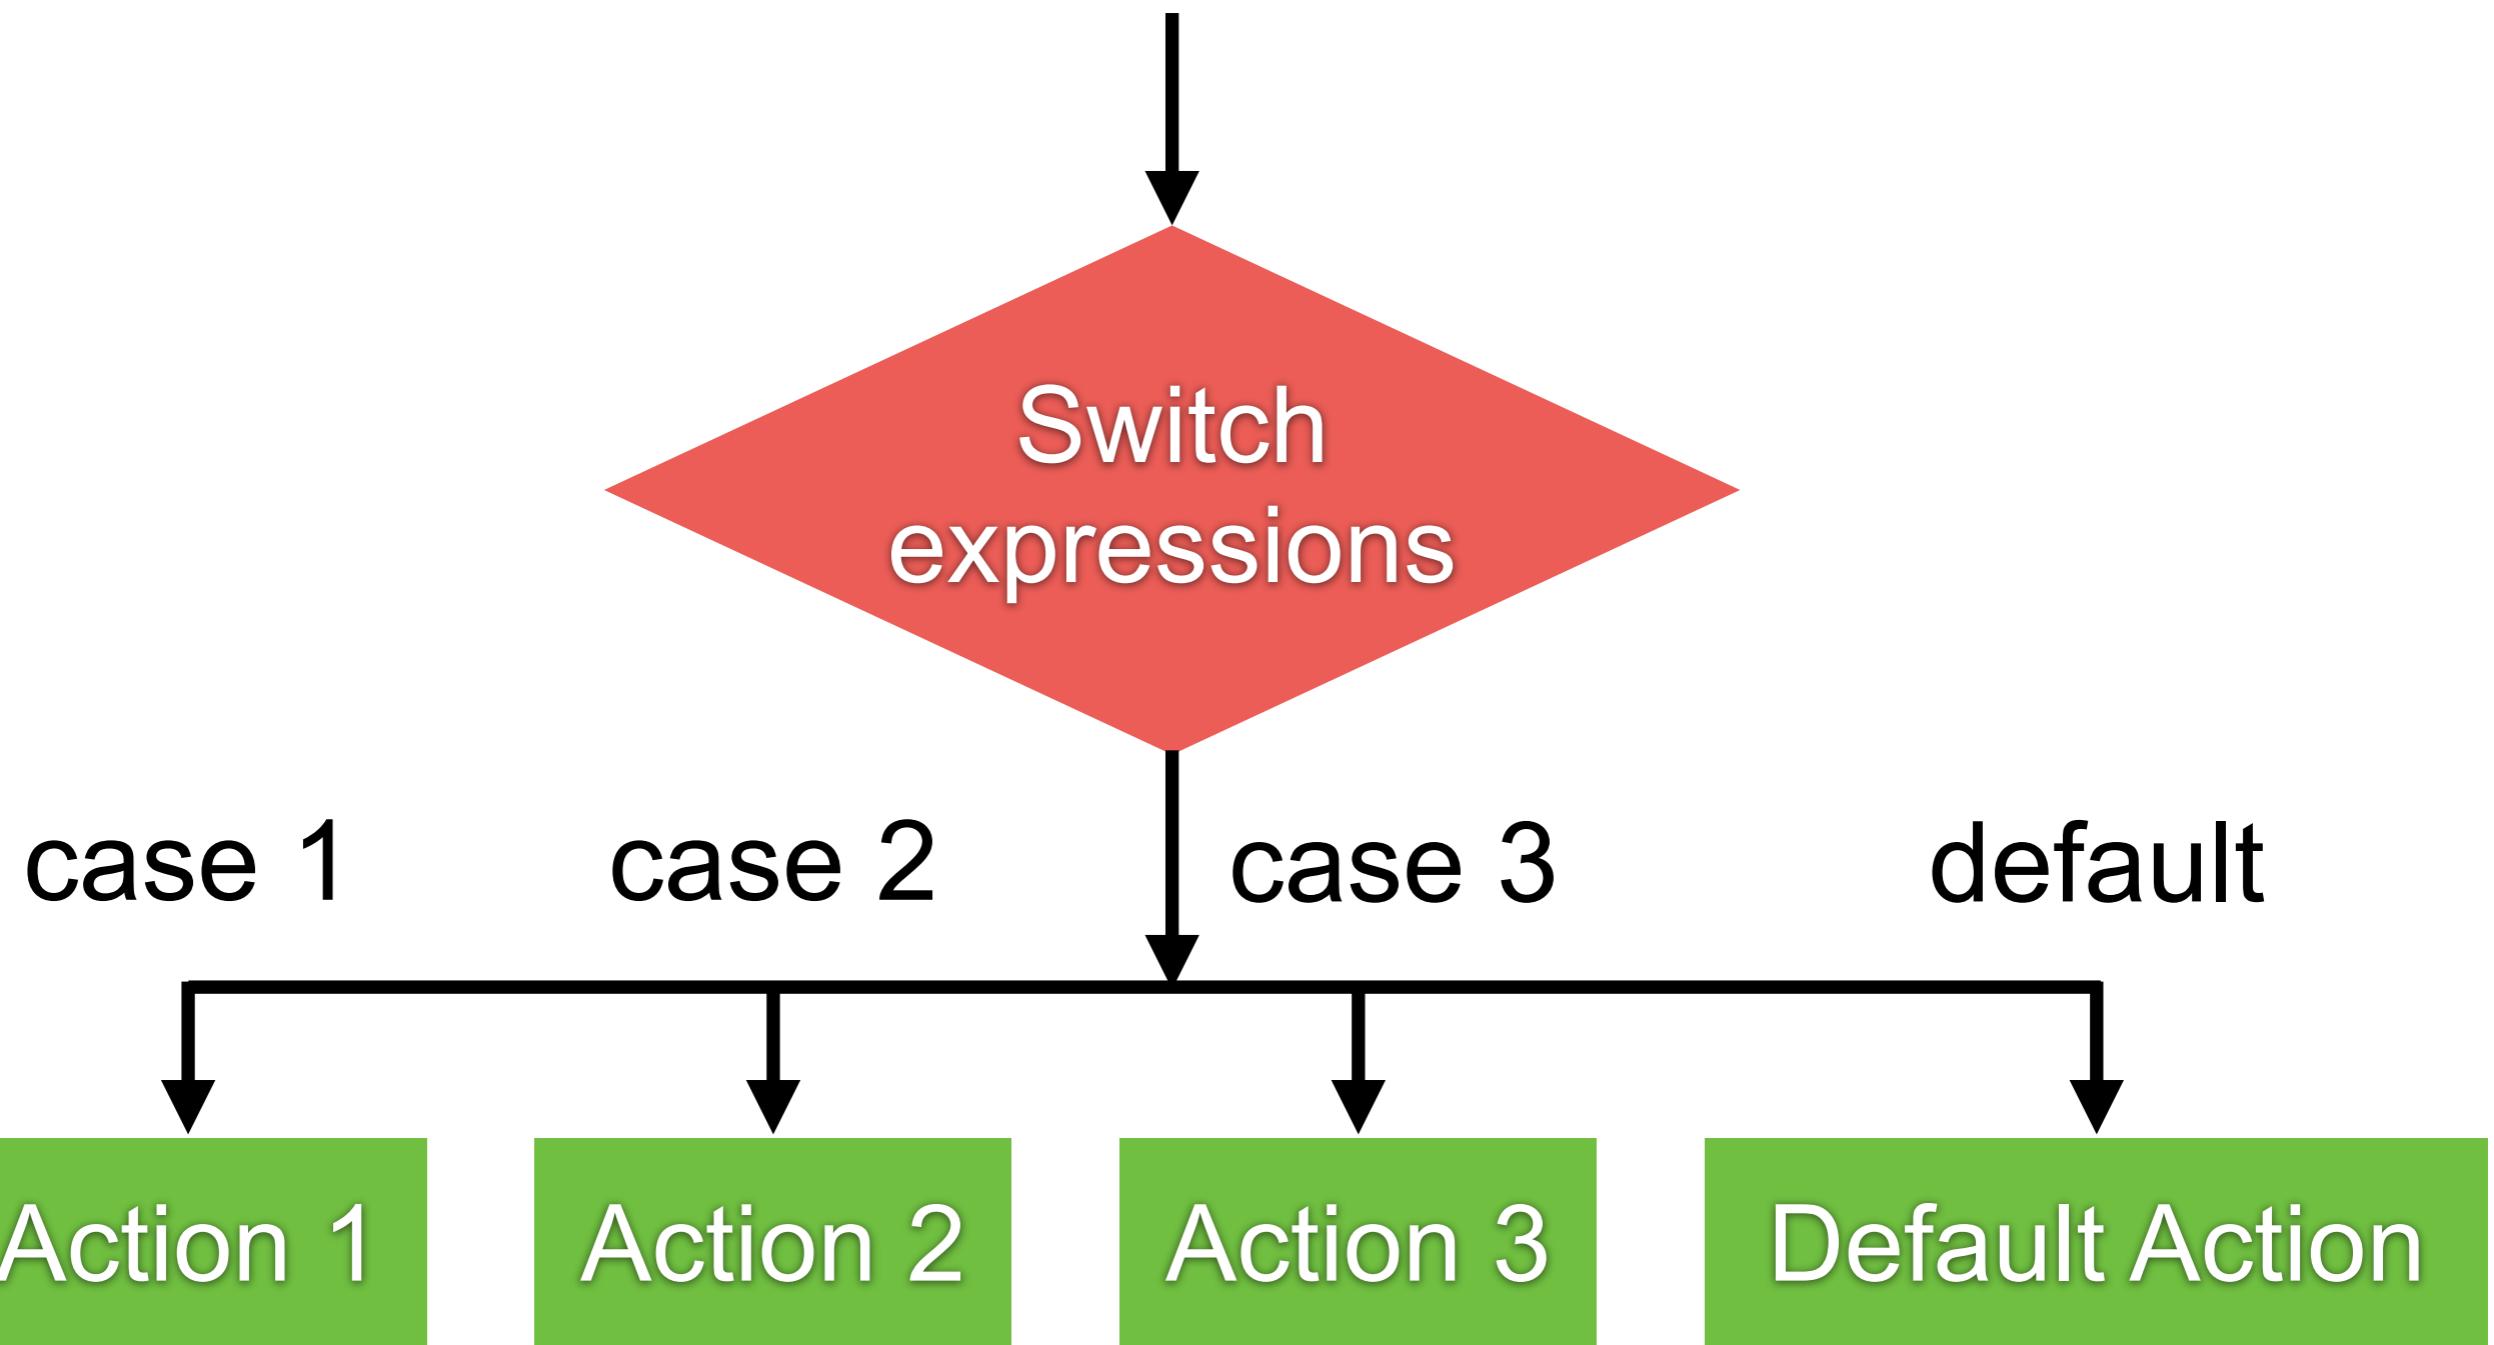

String Equality

Switch-Case

Switch-Case

Switch-Case

```
int number = 1;

switch (number) {
case 1:
    System.out.println("Case 1");
    break;
case 2:
    System.out.println("Case 1");
    break;

default:
    System.out.println("Default");
}
```

All about break !!

```
int number = 1;

switch (number) {
case 1:
    System.out.println("Case 1");
case 2:
    System.out.println("Case 1");

default:
    System.out.println("Default");
}
```

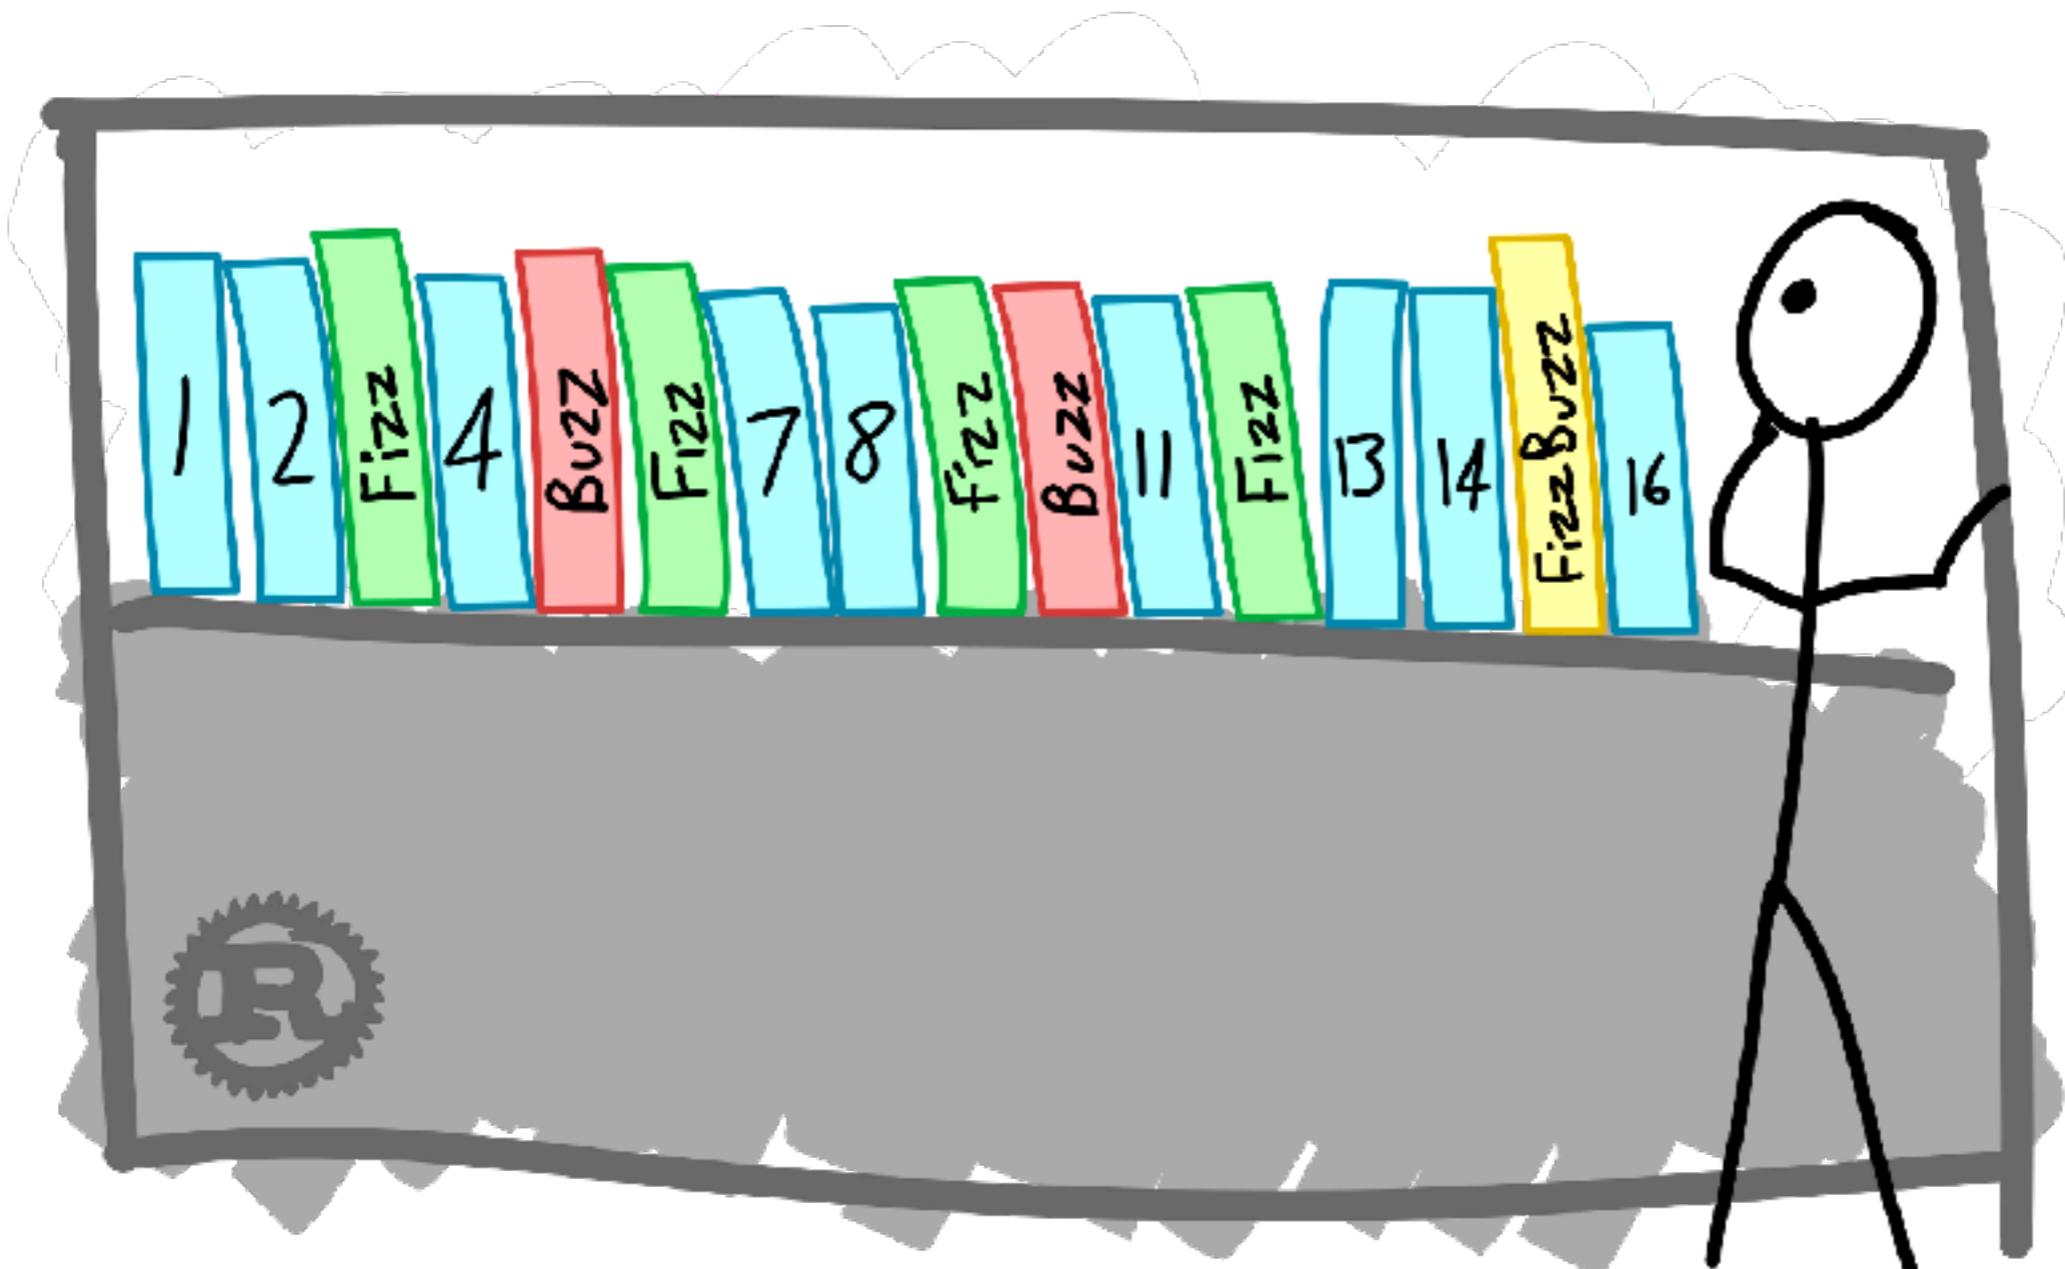

Workshop

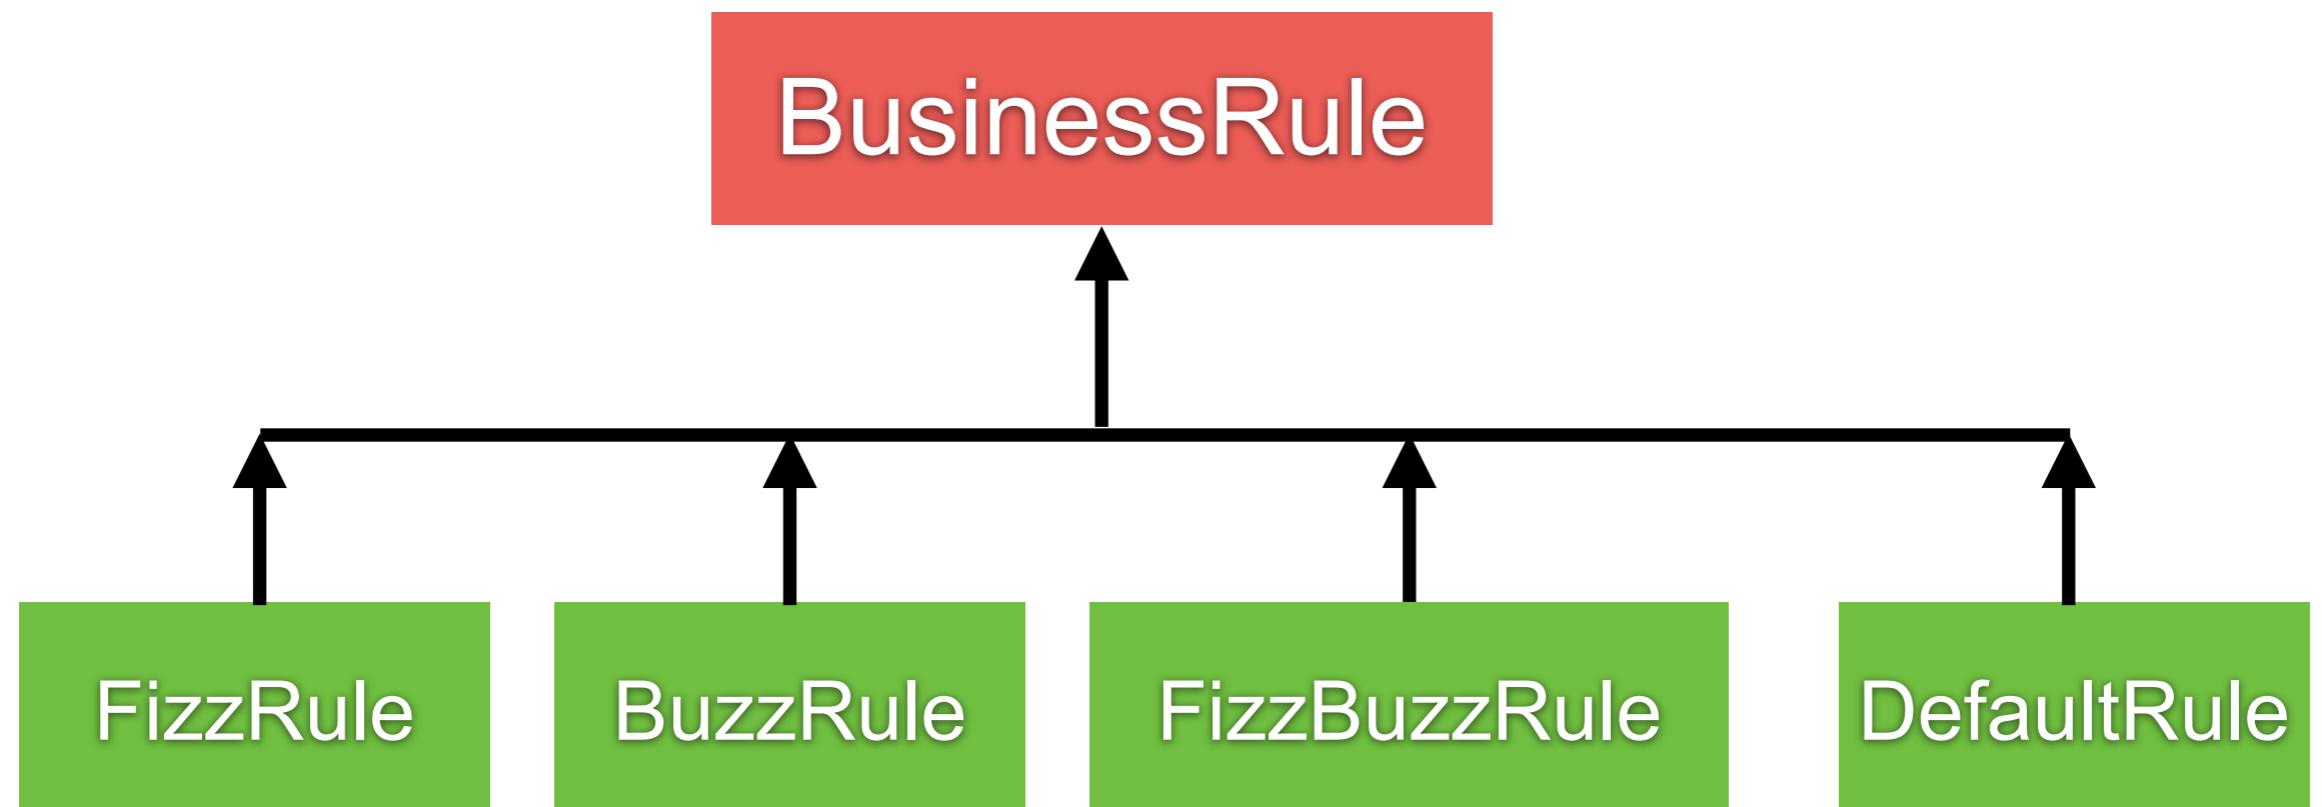

Conditional statement

FizzBuzz

FizzBuzz

Iteration statements

for statement

while statement

do-while statement

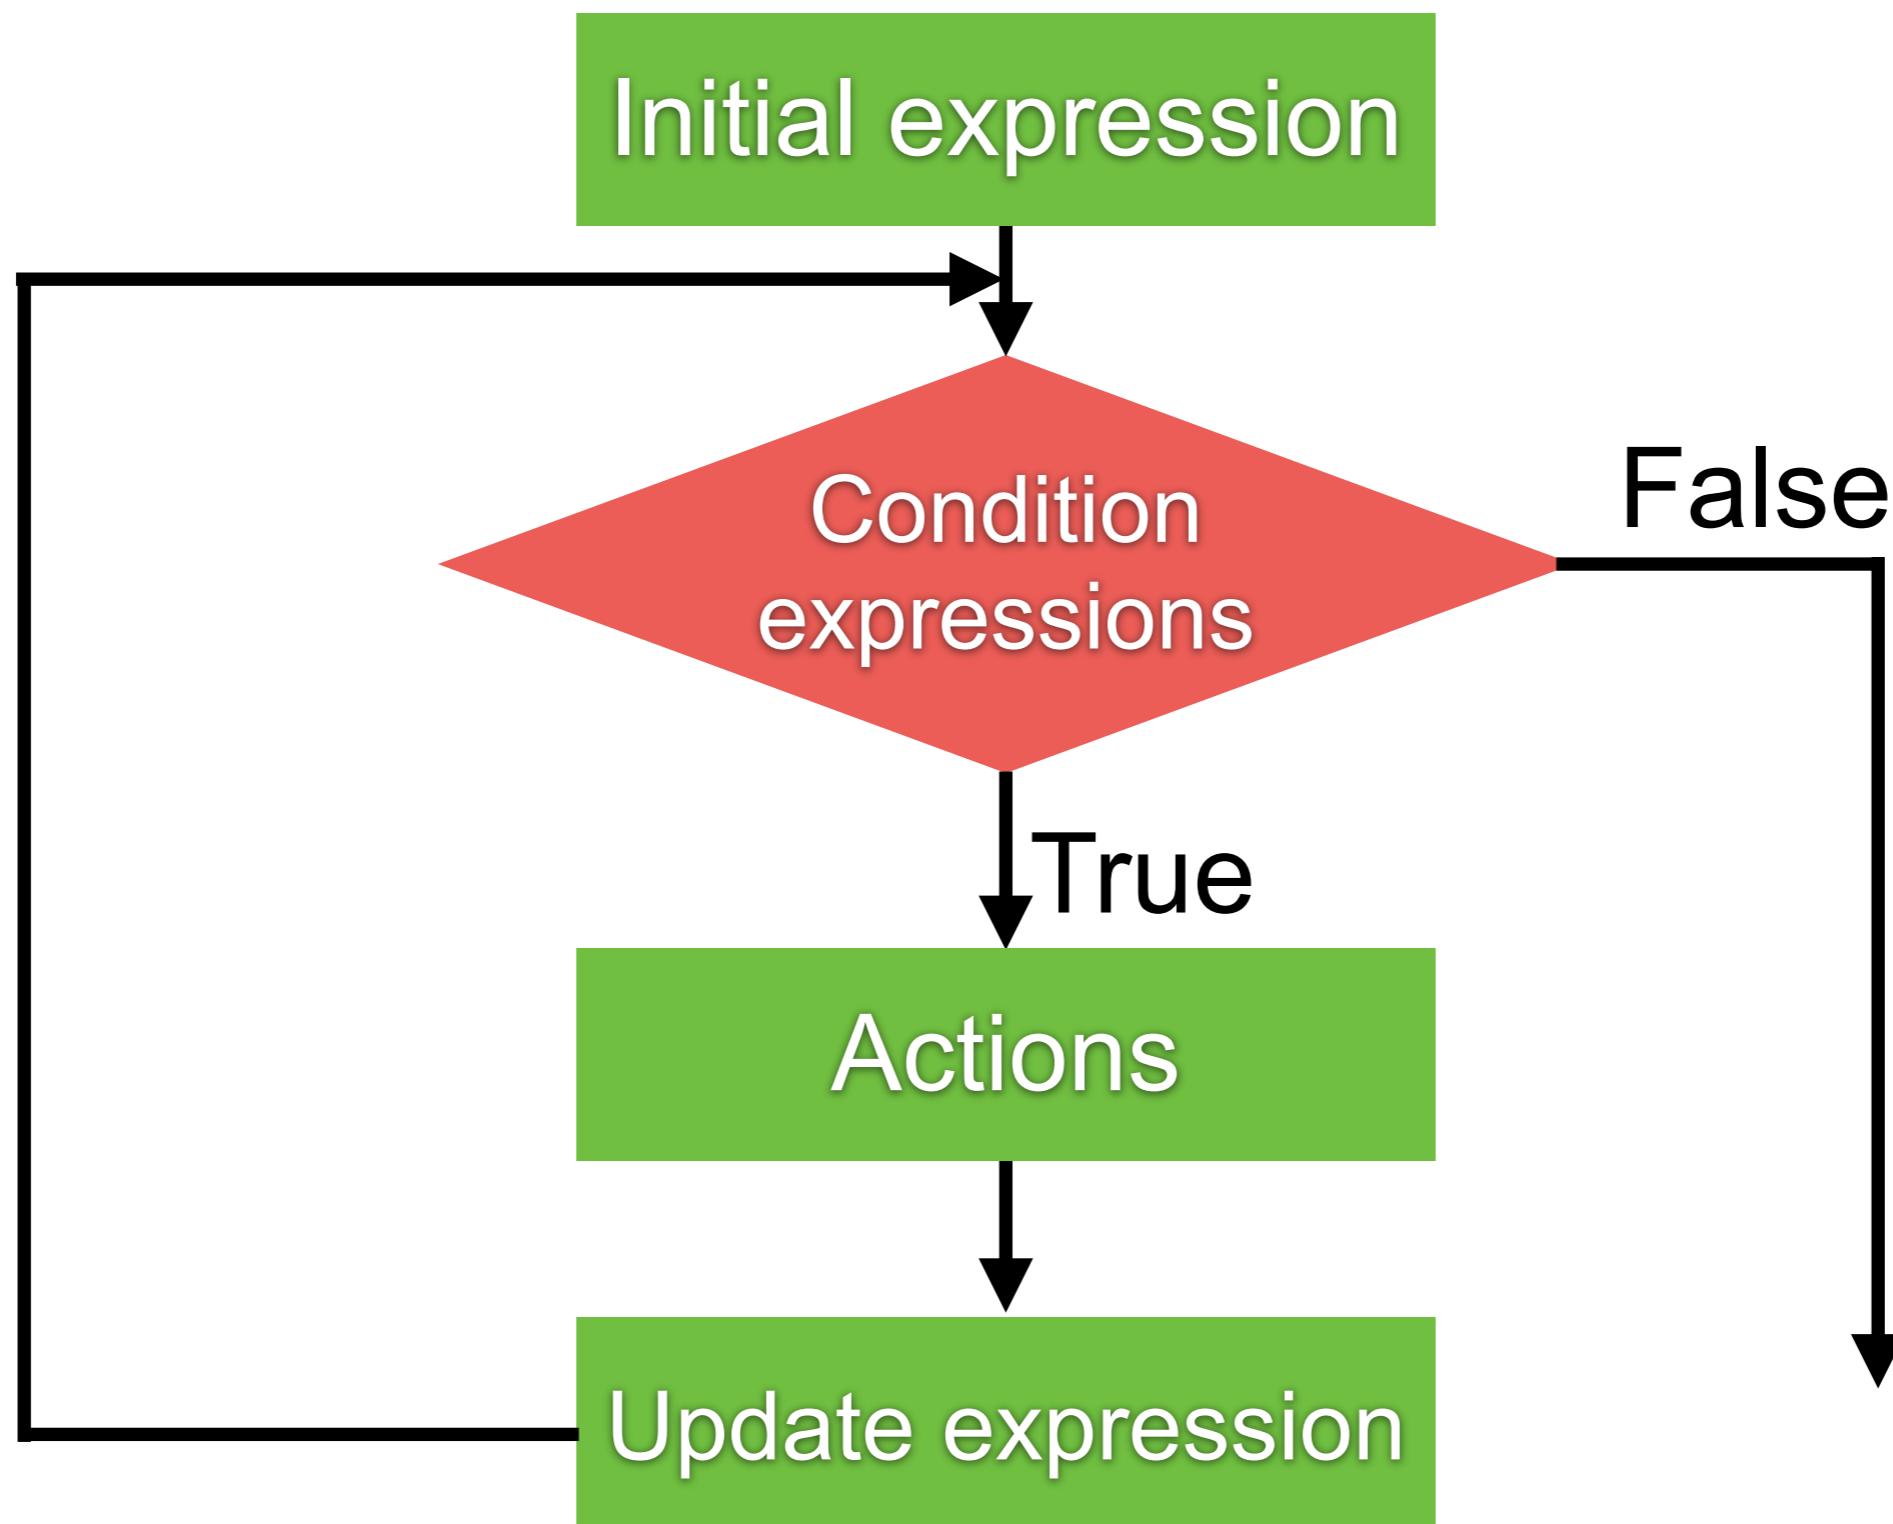

Why we need it ?

Find the sum of integer from 1 to 10 ?

For statement

For statement

In Java, For statement is recommended

```
for(int i=0; i<10; i++) {  
    System.out.println(i);  
}
```

```
String name = "Somkiat";  
for (int i = 0; i < name.length(); i++) {  
    System.out.println(name.charAt(i));  
}
```

For-each statement

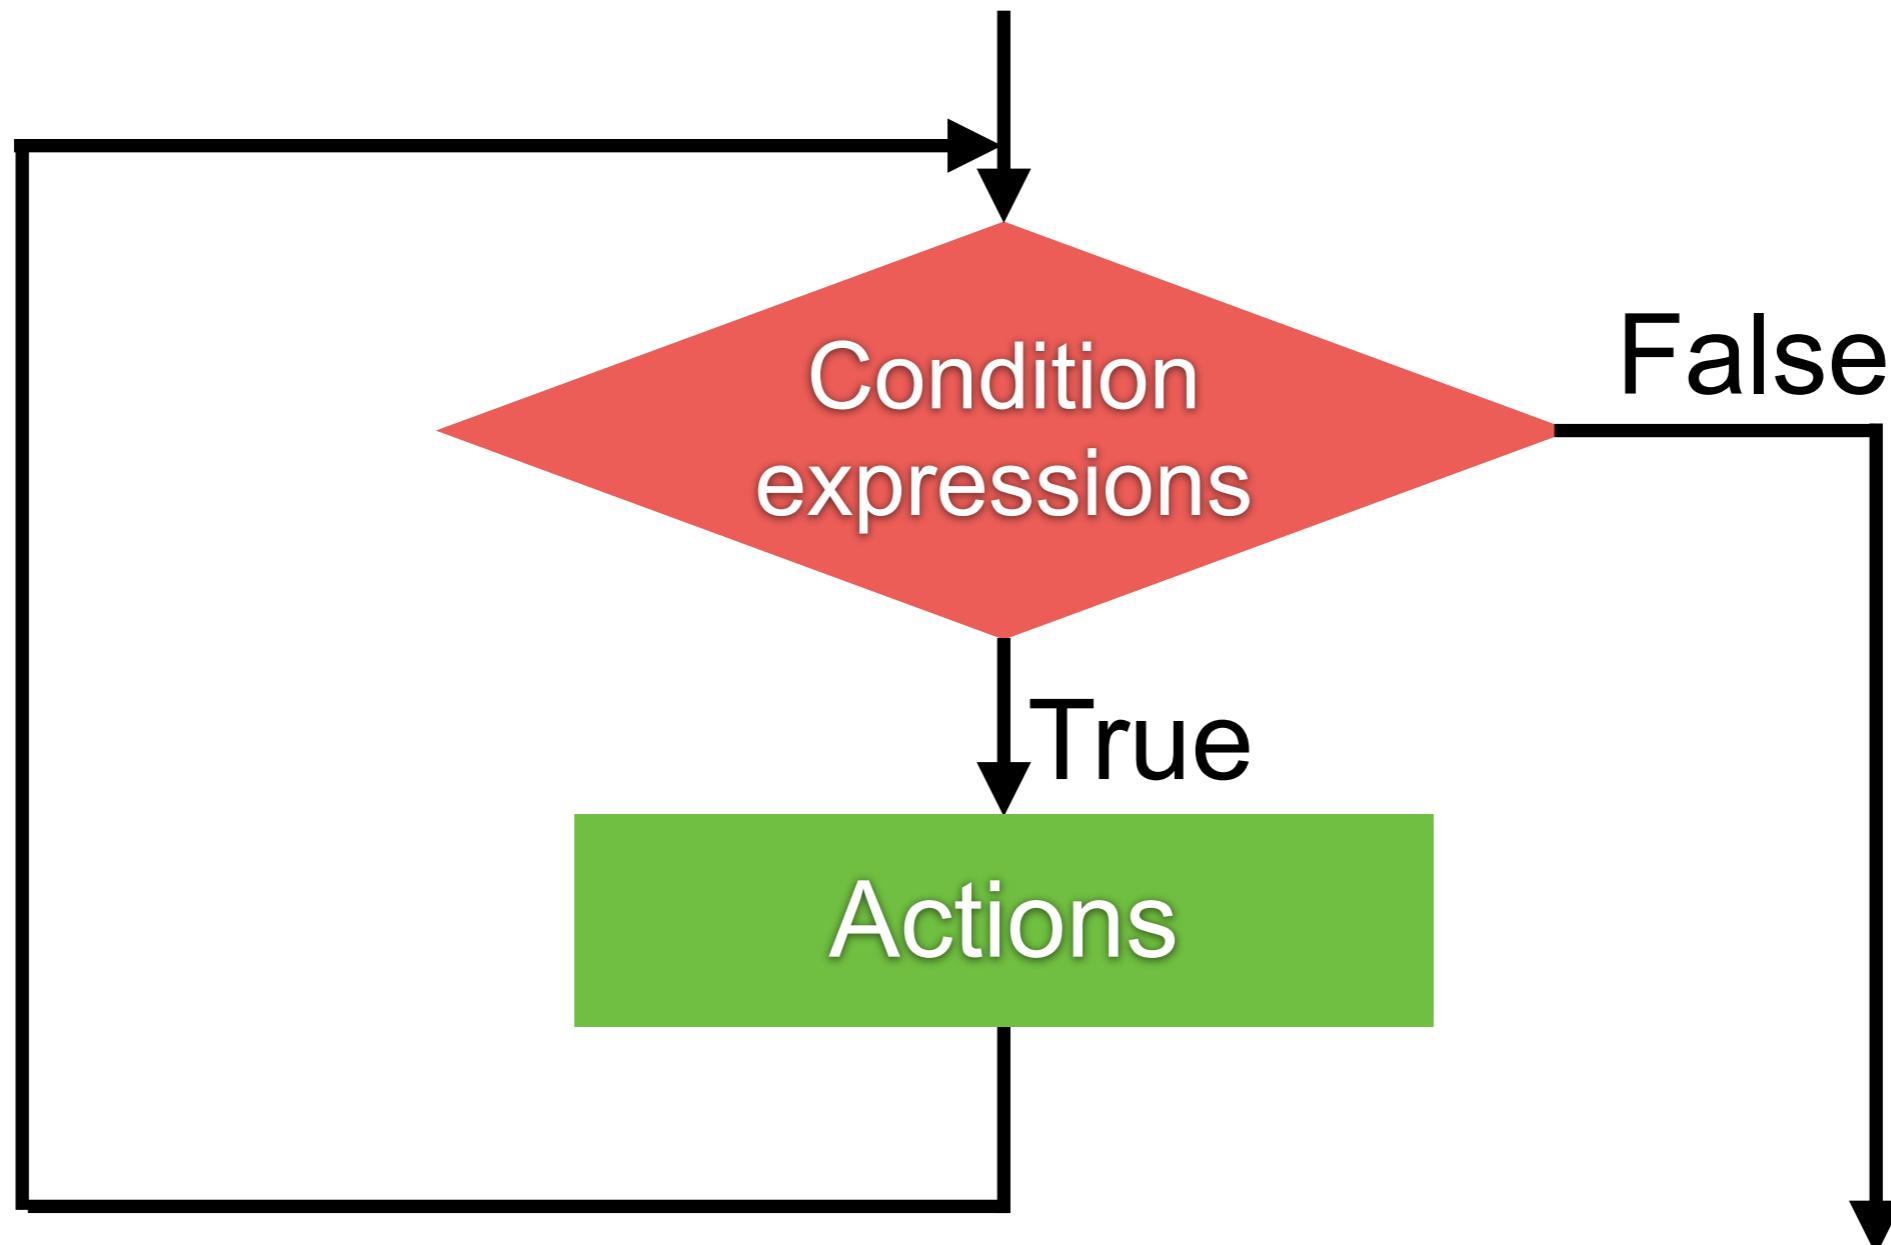

Array in Java ?

```
int[] numbers = {1, 2, 3, 4, 5};
```

```
for (int i : numbers) {  
    System.out.println(i);  
}
```

While statement

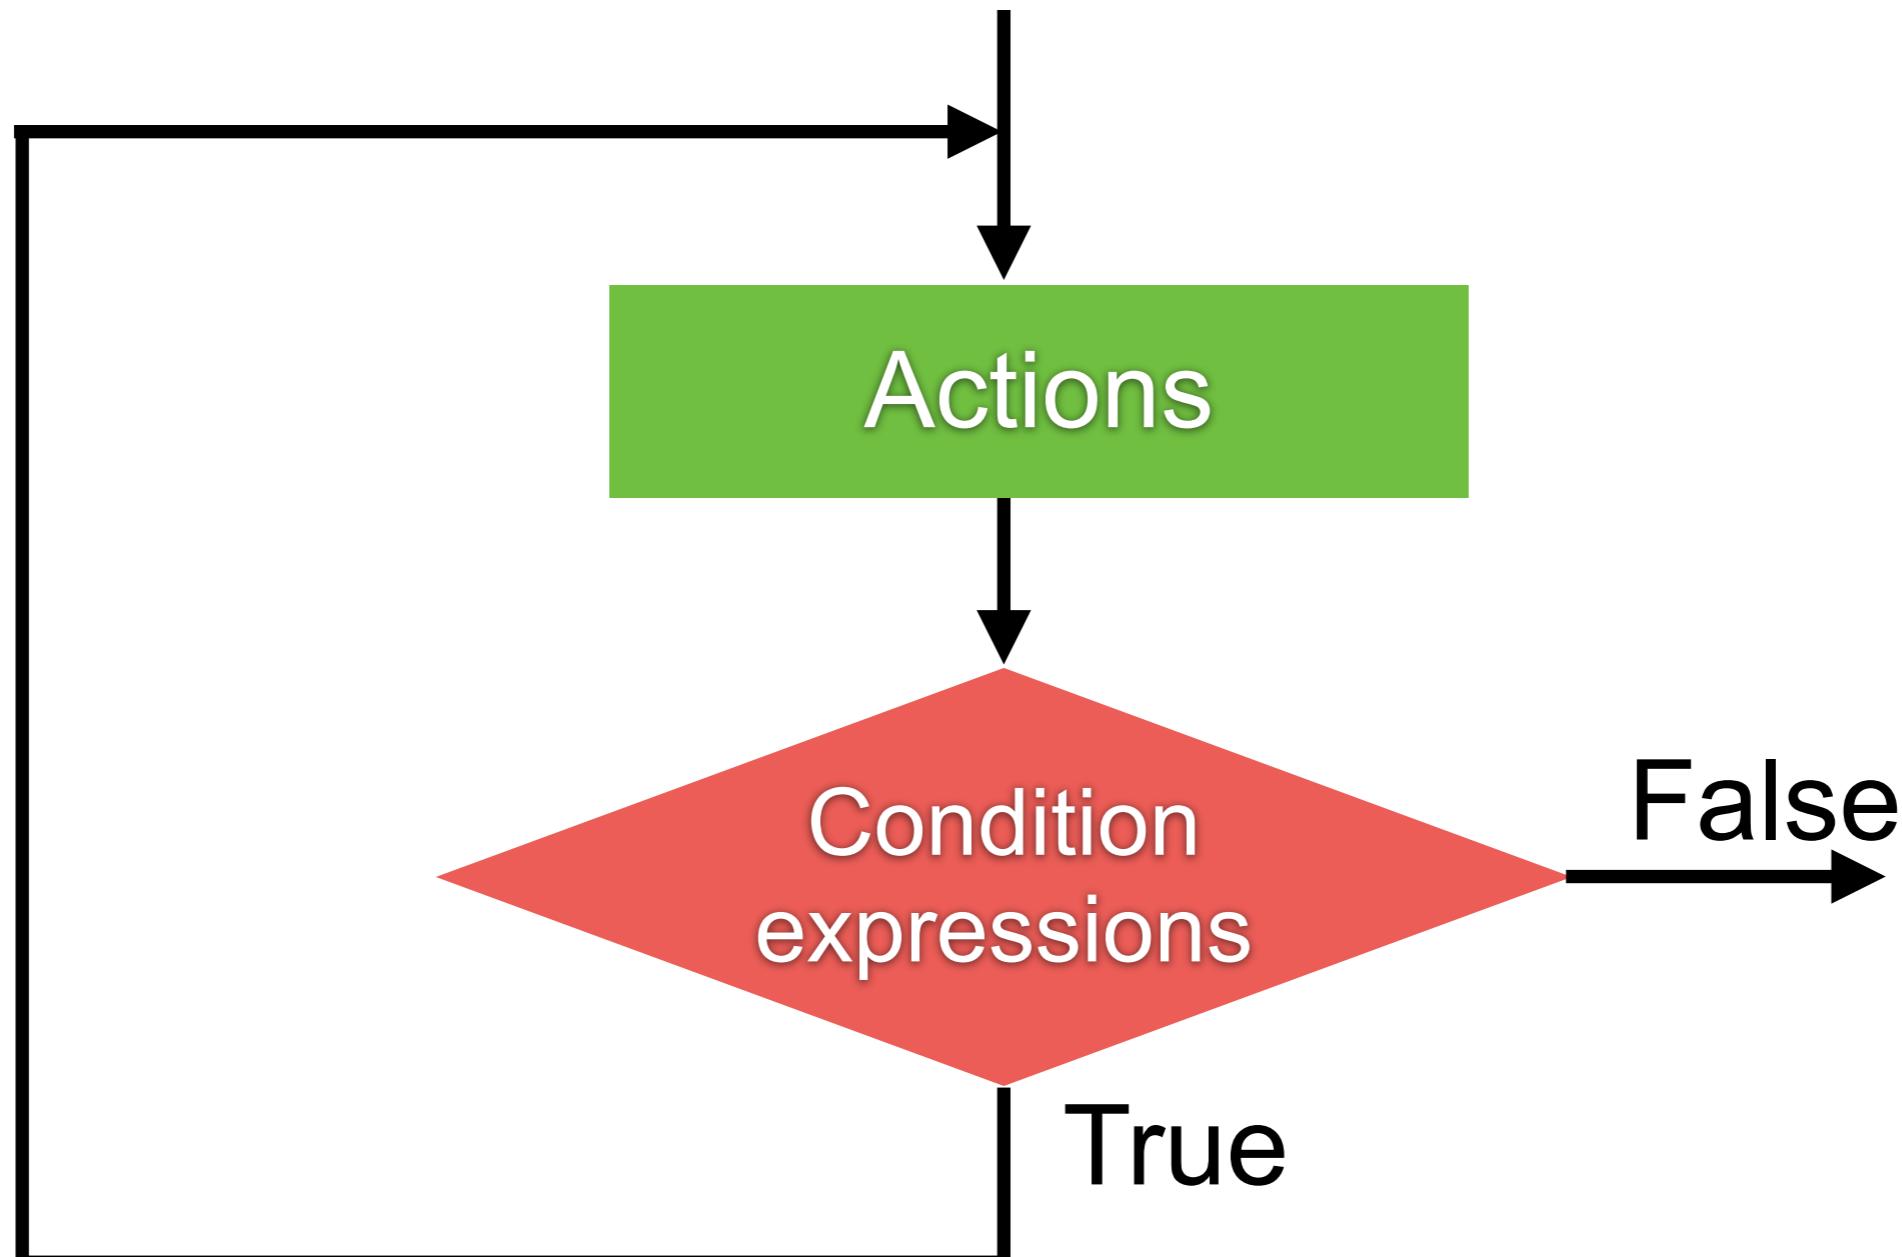

While statement

```
int i = 0;  
while(i<10) {  
    System.out.println(i);  
    i++;  
}
```

Do-while statement

Do-while statement

```
int i = 0;  
do {  
    System.out.println(i);  
    i++;  
} while (i < 10);
```

Avoid nested if and loop !!

Avoid nested if and loop !!

```
function register()
{
    if (empty($_POST)) {
        $msg = '';
        if (!$_POST['user_name']) {
            if (!$_POST['user_password_new']) {
                if (!$_POST['user_password_repeat']) {
                    if (strlen($_POST['user_password_new']) == $_POST['user_password_repeat']) {
                        if (strlen($_POST['user_password_new']) > 5) {
                            if (strlen($_POST['user_name']) < 6 || strlen($_POST['user_name']) > 24) {
                                if (preg_match('/[a-zA-Z]{2,64}!@/i', $_POST['user_name'])) {
                                    $user = read_user($_POST['user_name']);
                                    if (!check($user['user_name'])) {
                                        if (!$_POST['user_email']) {
                                            if (strlen($_POST['user_email']) < 65) {
                                                if (filter_var($_POST['user_email'], FILTER_VALIDATE_EMAIL)) {
                                                    create_user();
                                                    $SESSION['msg'] = 'You are now registered so please login';
                                                    header('Location: ' . SERVER('PHP_SELF'));
                                                    exit();
                                                } else $msg = 'You must provide a valid email address';
                                            } else $msg = 'Email must be less than 64 characters';
                                        } else $msg = 'Email cannot be empty';
                                    } else $msg = 'Username already exists';
                                } else $msg = 'Username must be only a-z, A-Z, 0-9';
                            } else $msg = 'Username must be between 2 and 64 characters';
                        } else $msg = 'Password must be at least 6 characters';
                    } else $msg = 'Passwords do not match';
                } else $msg = 'Empty Password';
            } else $msg = 'Empty Username';
        }
        $SESSION['msg'] = $msg;
    }
    return register_form();
}
```

icompile.eladkarako.com

Workshop

Workshop with Prime Factor

Prime Factor

Prime numbers that divide an integer without remainder

Prime numbers are number > 1 that has no divisors

| Input | Output |
|-------|---------|
| 2 | 2 |
| 3 | 3 |
| 4 | 2, 2 |
| 6 | 2, 3 |
| 8 | 2, 2, 2 |
| 10 | 2, 5 |
| 12 | 2, 2, 3 |

Working with Array

Type of array

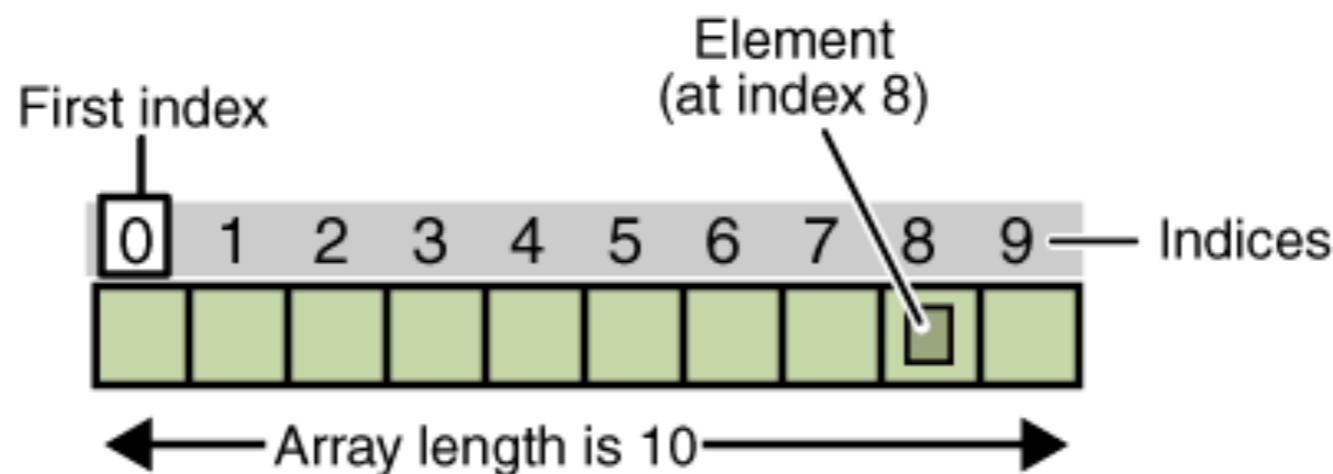

One-dimensional array
Multi-dimensional array

One-dimensional array

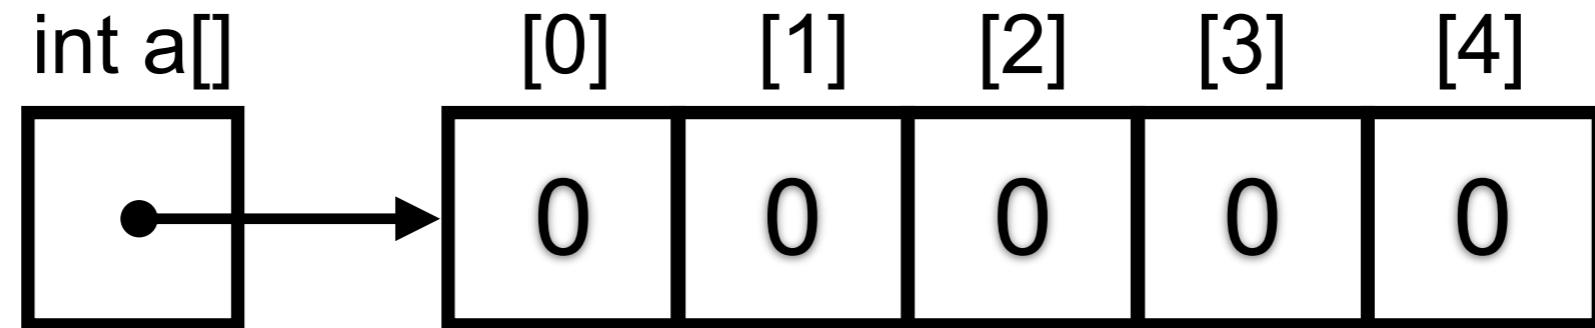

Use to store list of element

ElementType[] elements;

One-dimensional array

```
int[] a = new int[5];
```

Using and initial array

```
// Declare variables
int[] intergers;
int intergers2[];

// Initial with fixed length
Double[] doubles = new Double[5];

// Initial with value
String[] strings = { "J", "A", "V", "A" };
```

Default value of number type

Default value = 0

```
int[] numbers = new int[5];  
  
for (int i = 0; i < numbers.length; i++) {  
    System.out.println(numbers[i]); // 0  
}  
  
for (int i : numbers) {  
    System.out.println(i); // 0  
}
```

Default value of boolean type

Default value = false

```
boolean[] booleans = new boolean[5];  
  
for (boolean b : booleans) {  
    System.out.println(b); // false  
}
```

Default value of non-primitive

Default value = null

```
Integer[] integers = new Integer[5];  
  
for (Integer integer : integers) {  
    System.out.println(integer);  
}
```

Access data in array

numbers[index]

index of array start with 0

```
int[] numbers = { 1, 2, 3, 4, 5 };
numbers[0] = 10;
numbers[1] = 20;
numbers[2] = 30;
numbers[3] = 40;
numbers[4] = 50;

for (int i = 0; i < numbers.length; i++) {
    System.out.println(numbers[i]);
}
```

Workshop with Sorting number in array

| | | | | | | |
|---|---|---|----|---|---|---|
| 1 | 5 | 2 | 10 | 3 | 8 | 3 |
|---|---|---|----|---|---|---|

Multi-dimensional array

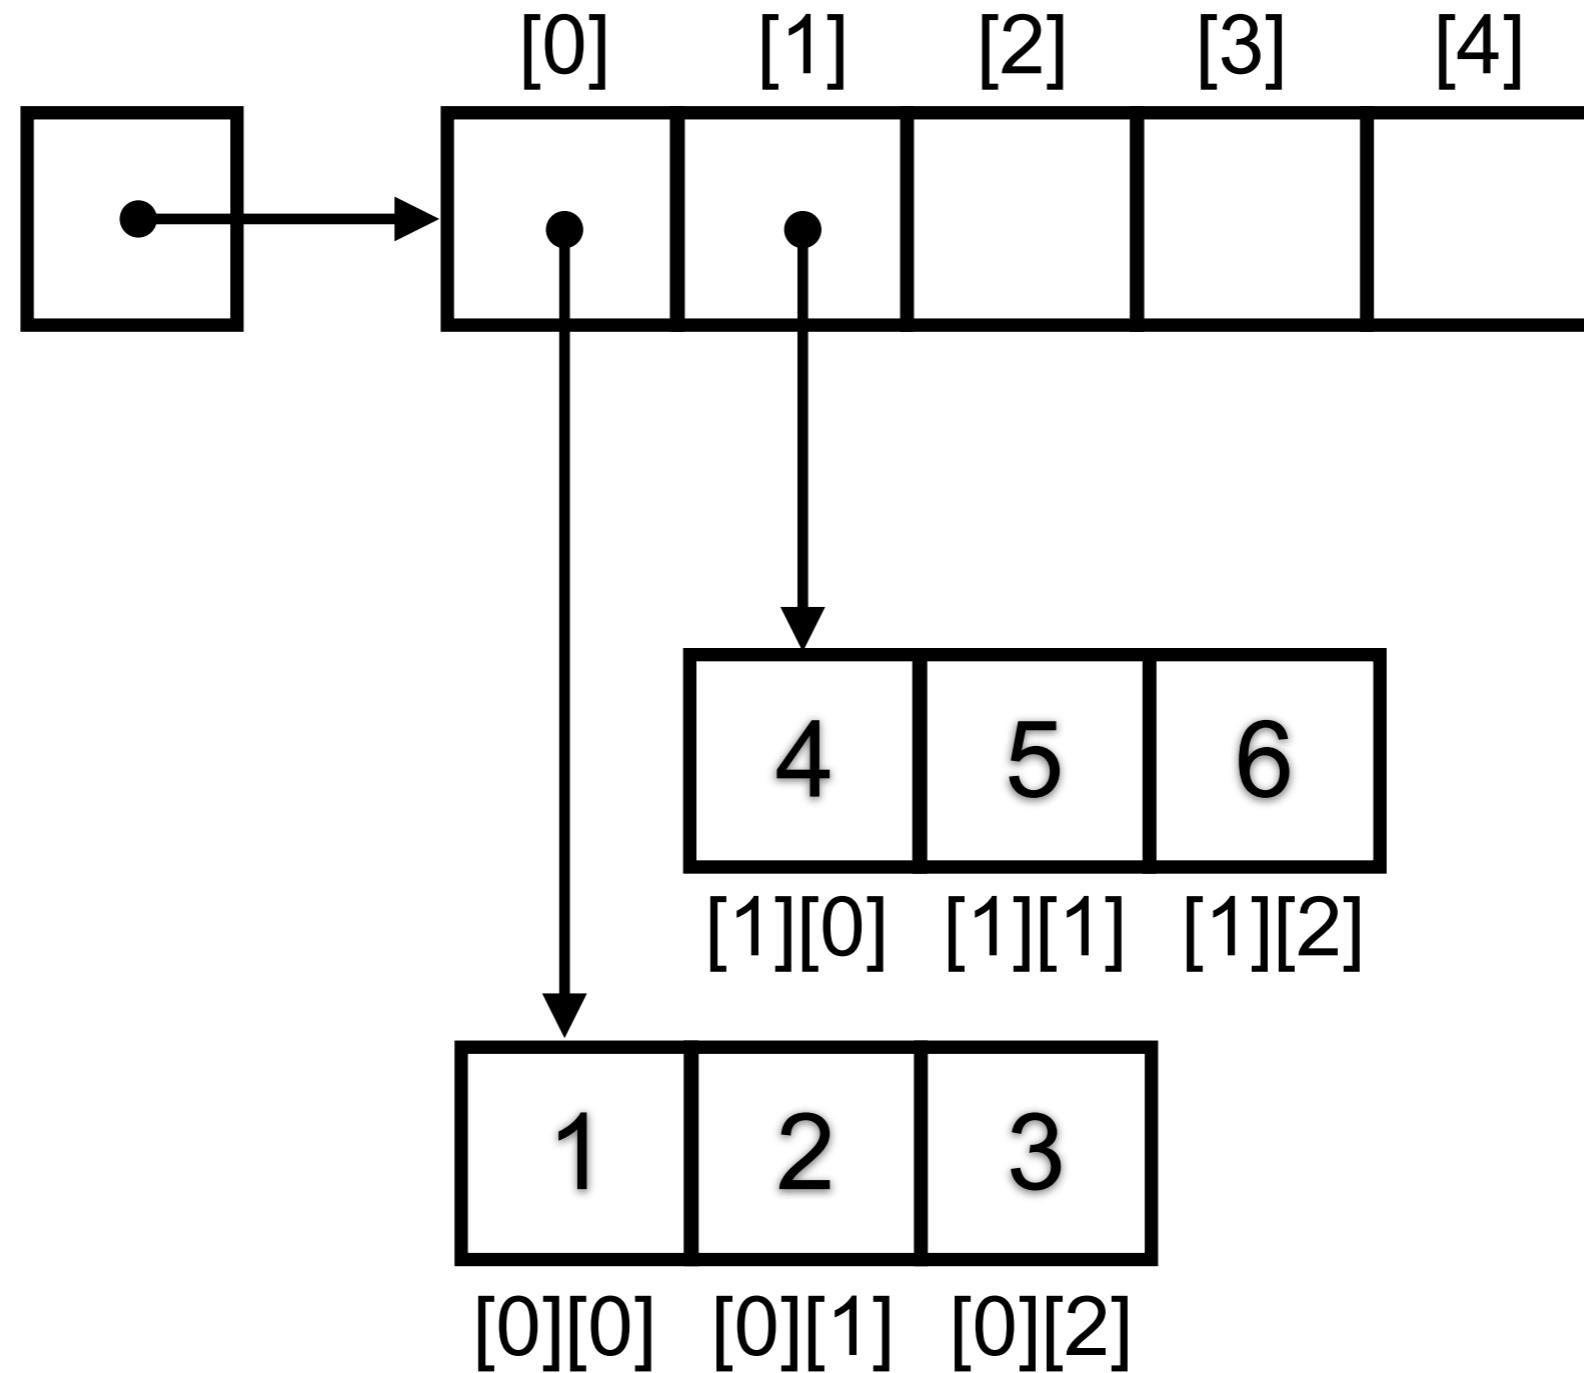

Elements in array can be array

ElementType[][][] elements;

| | Column 1 | Column 2 | Column 3 | Column 4 |
|-------|----------|----------|----------|----------|
| Row 1 | x[0][0] | x[0][1] | x[0][2] | x[0][3] |
| Row 2 | x[1][0] | x[1][1] | x[1][2] | x[1][3] |
| Row 3 | x[2][0] | x[2][1] | x[2][2] | x[2][3] |

Multi-dimensional array

Using and initial array

```
int[][] twoDimension = new int[3][3];  
int[][][] threeDimension = new int[2][2][2];
```

Object-Oriented Programming

OOP with Java Part 1

Classes and Objects
Constructors
Inheritance
Polymorphism

Classes and object

Classes

Non-primitive data type in Java

Blueprint of object

Objects

An instance of a class

Creating new class

Class name

List of properties/attributes (data members)

List of behaviors/methods

Constructor

Creating a new class

Create file Employee.java

```
public class Employee {  
  
    // Properties/states  
    private int id;  
    private String name;  
    private String address;  
  
    // Behaviors/methods  
    public void setData() {  
  
    }  
  
    public String getData() {  
        return "some data";  
    }  
}
```

Constructor ?

Special method invoked when objects of the class are created

```
public class Employee {  
    // Properties/states  
    private int id;  
    private String name;  
    private String address;  
  
    // Behaviors/methods  
    public void setData() {  
    }  
  
    public String getData() {  
        return "some data";  
    }  
}
```

Default constructor

For all classes have default constructor (implicit)

```
public class Employee {  
    // Default constructor  
    public Employee() {  
    }  
}
```

Overloaded constructor

Constructor can have more than one with different parameters

Many ways to create object

Overloaded constructor

```
public class Employee {  
    // Default constructor  
    public Employee() {  
    }  
  
    // Overload constructor 1  
    public Employee(int id) {  
        this.id = id;  
    }  
  
    // Overload constructor 2  
    public Employee(int id, String name) {  
        this.id = id;  
        this.name = name;  
    }  
}
```

Modifier in Java ?

```
public class Employee {  
  
    // Properties/states  
    private int id;  
    private String name;  
    private String address;  
  
    // Behaviors/methods  
    public void setData() {  
  
    }  
}
```

Modifier in Java

public
private
protected
default

Modifier in Java

| Visibility | Private | Default | Protected | Public |
|-----------------------------------|----------------|----------------|------------------|---------------|
| Same class | Yes | Yes | Yes | Yes |
| Same package | No | Yes | Yes | Yes |
| Different package subclass | No | No | Yes | Yes |
| Different package non-subclass | No | No | No | Yes |

Create instances from class

```
Employee employee1;  
employee1 = new Employee();  
employee1.setData();
```

```
Employee employee2 = new Employee();  
employee2.setData();
```

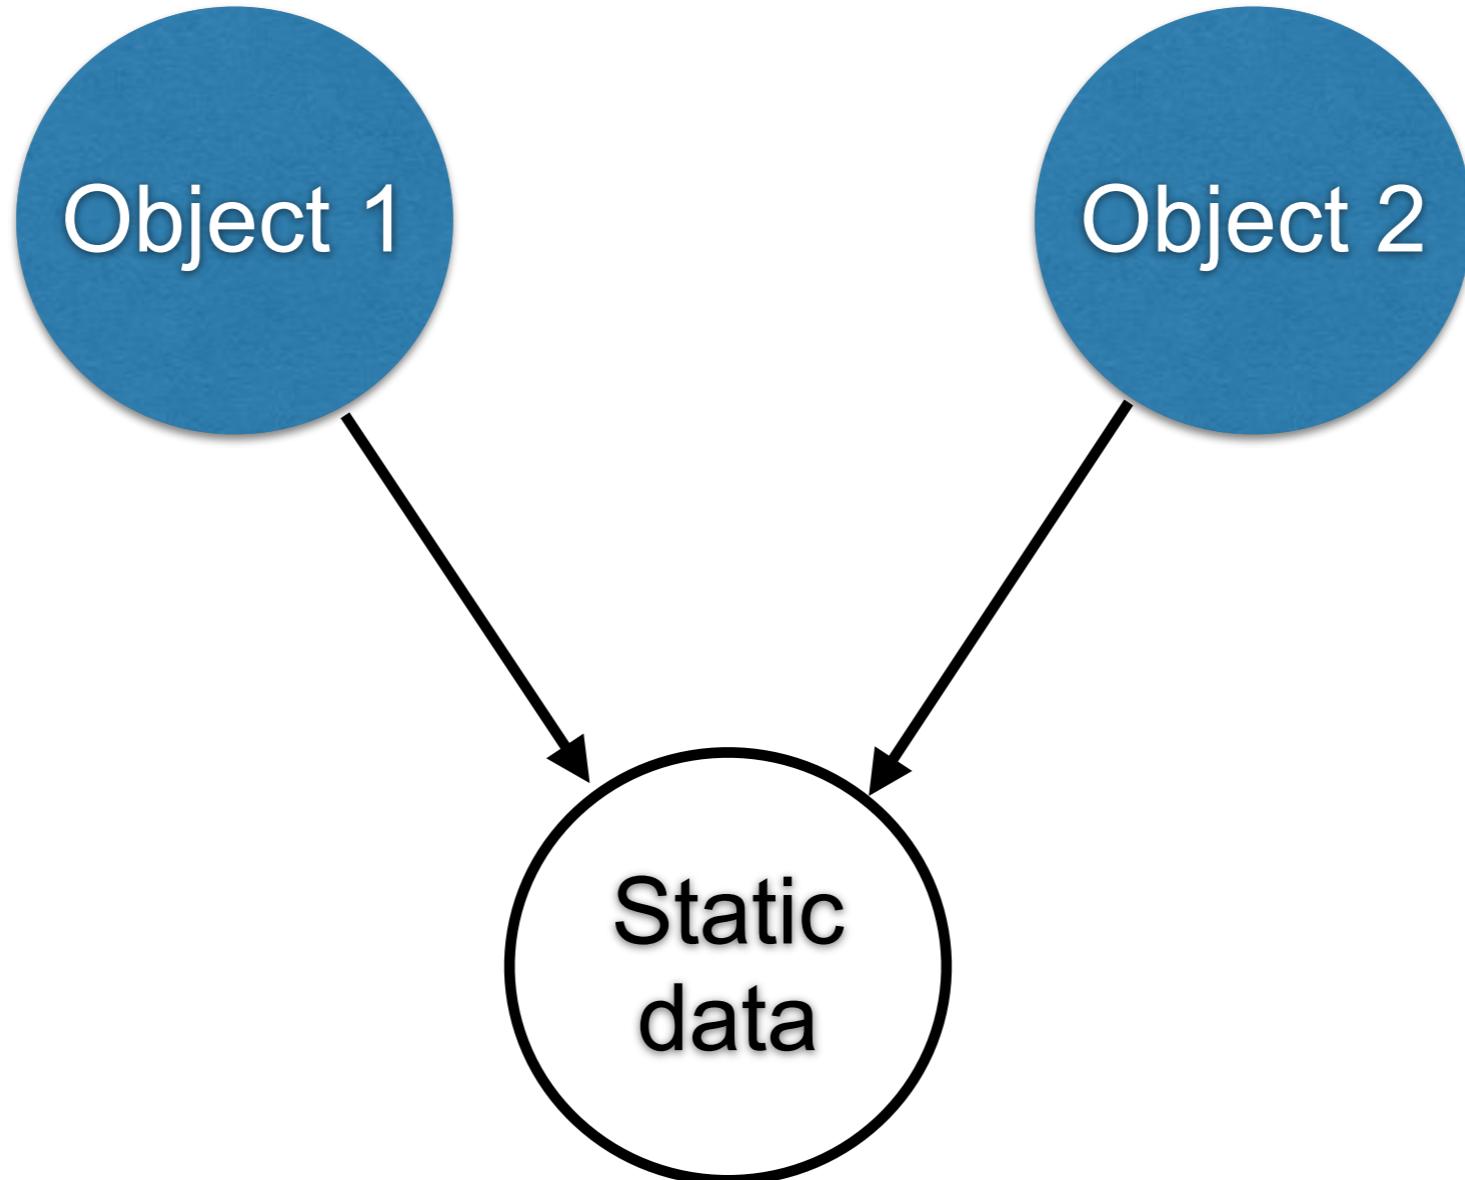

Static and non-static data member

```
public class Employee {  
    // Non-static data member  
    public int id;  
    public String name;  
  
    // Static data member  
    public static int counter;  
}
```

Static data member

Be careful to use static !!

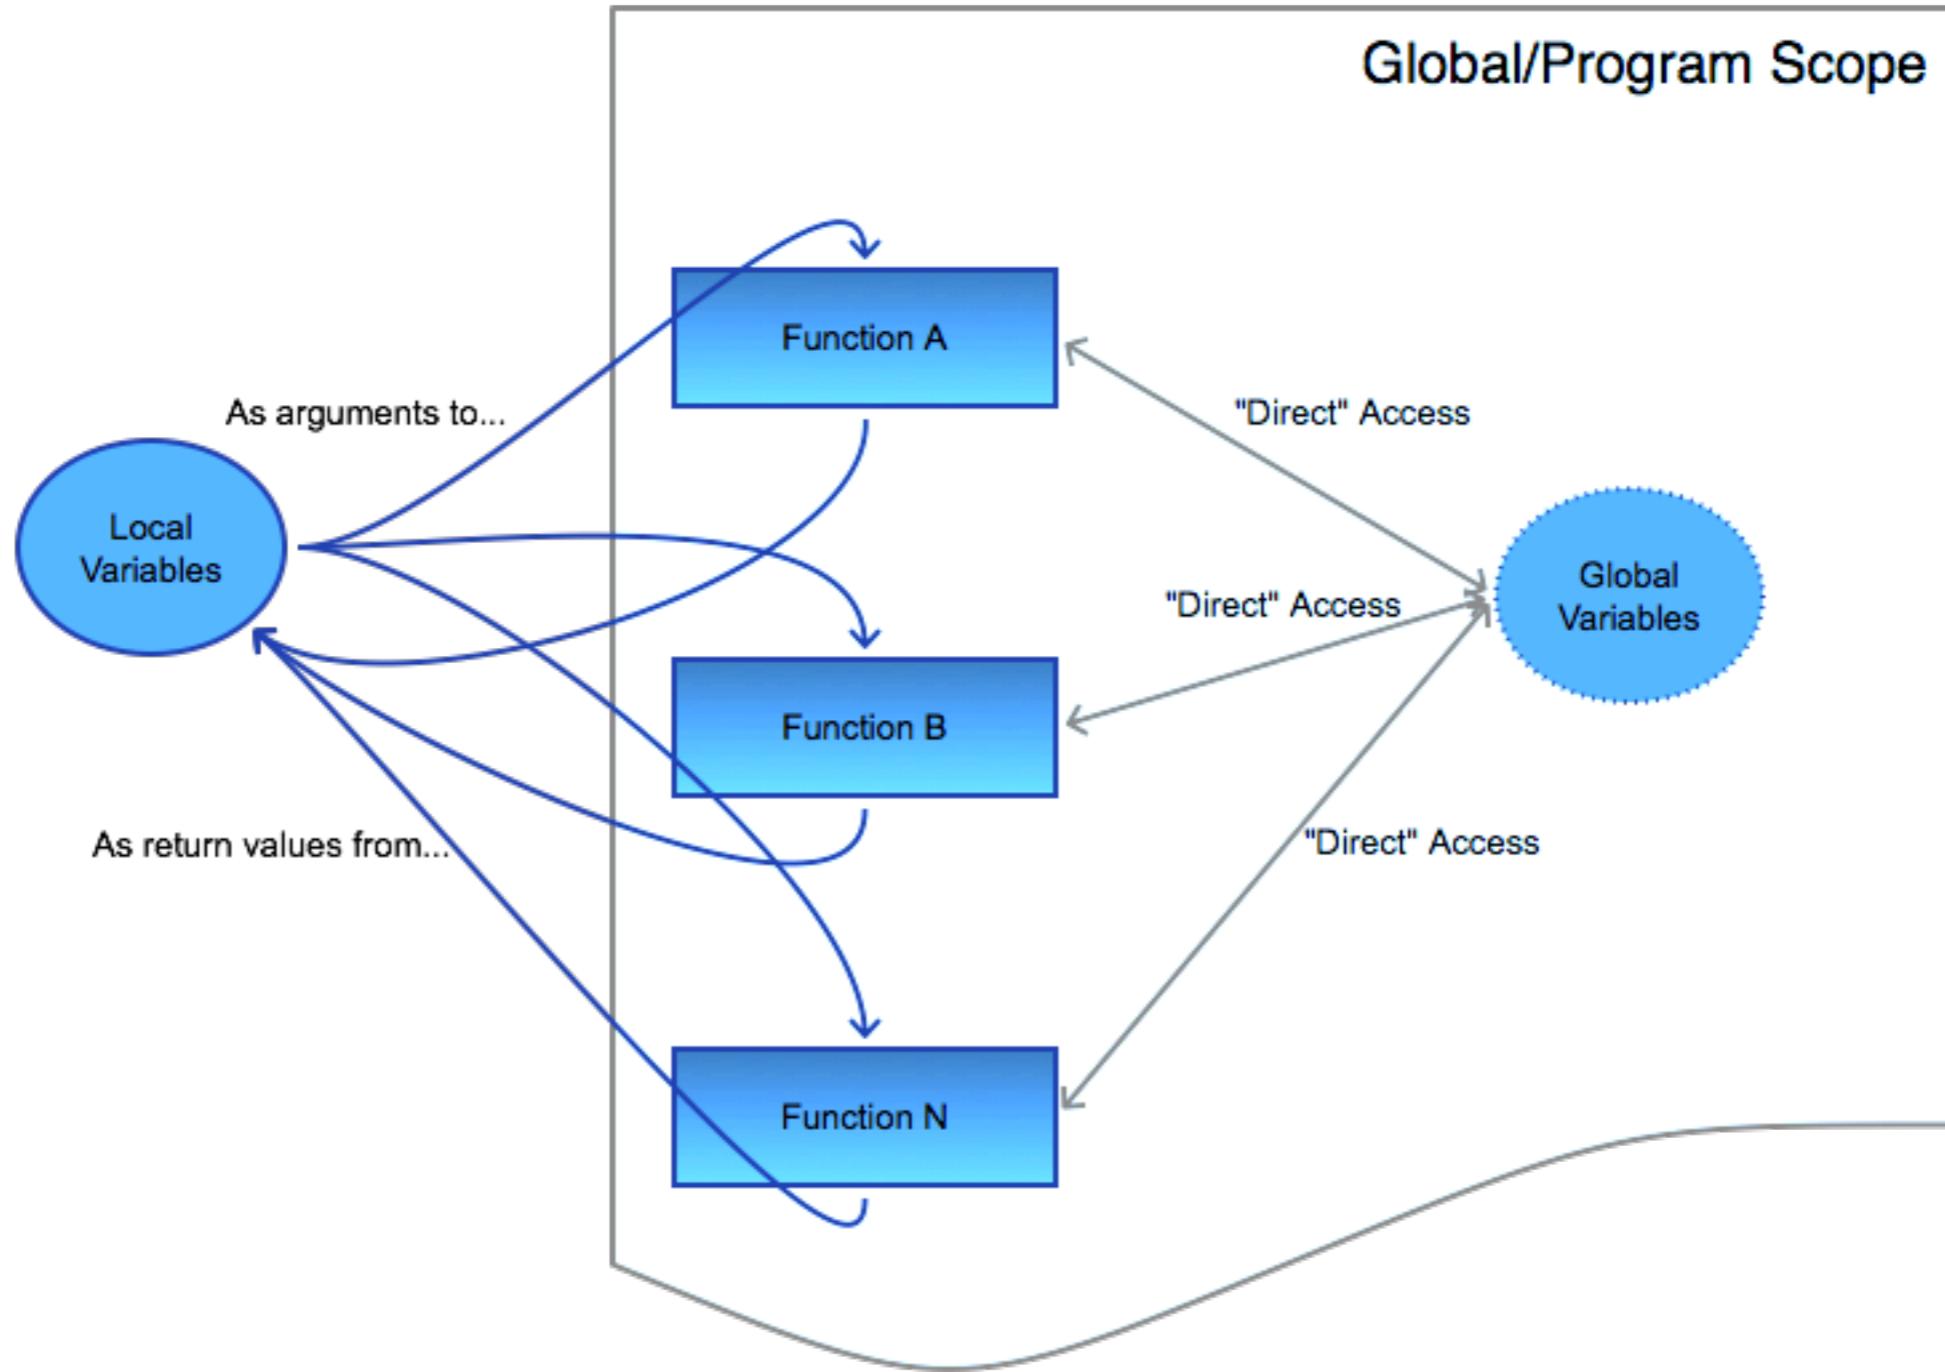

```
Employee employee1 = new Employee();
employee1.counter++; // Warning
Employee.counter++;
```

```
Employee employee2 = new Employee();
employee2.counter++; // Warning
Employee.counter++;
```

```
System.out.println(employee1.counter); // 2 !!
System.out.println(employee2.counter); // 2 !!
```

Global states are bad !!

Methods of class

Describe behaviors of object of the class
Static and Non-static method (instance)

Methods

Non-static method (instance)

Invoked by other class via the **instance name**

Using dot (.) operator

Default of all methods

Static method

Create method with **static** keyword

Invoked by other class via the **class name**

Methods of class

```
(public|private|protected) (static) (return type)  
methodName( list of arguments ) {  
  
    // Body of method  
  
}
```

Examples

```
public void setId(int id) {  
    this.id = id;  
}
```

```
public int getId() {  
    return id;  
}
```

Suggestion in OOP

Data members in class are defined with **private** to prevent users of class accessing directly

Access data members via **public method**

Tips for class

How to improve the result ?

```
Employee employee = new Employee();  
System.out.println(employee);
```

Employee@33909752

Tips for class

Try to **overrides** `toString()` method

```
@Override  
public String toString() {  
    return "Employee [id=" + id +  
        ", name=" + name + "]";  
}
```

Thinking before create class

Single Responsibility Principle

Single Responsibility Principle

Just because you *can* doesn't mean you *should*.

Inheritance

Ability to derive a new class from existing class

superclass / base class

subclass / derived class

Additional properties and behaviors

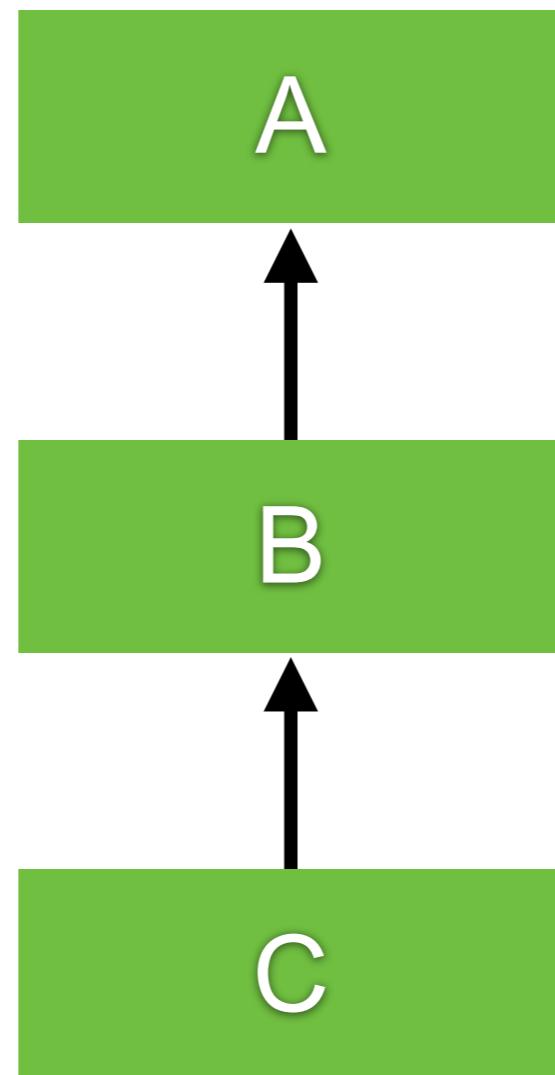

How to create ?

Extends from base class only one class

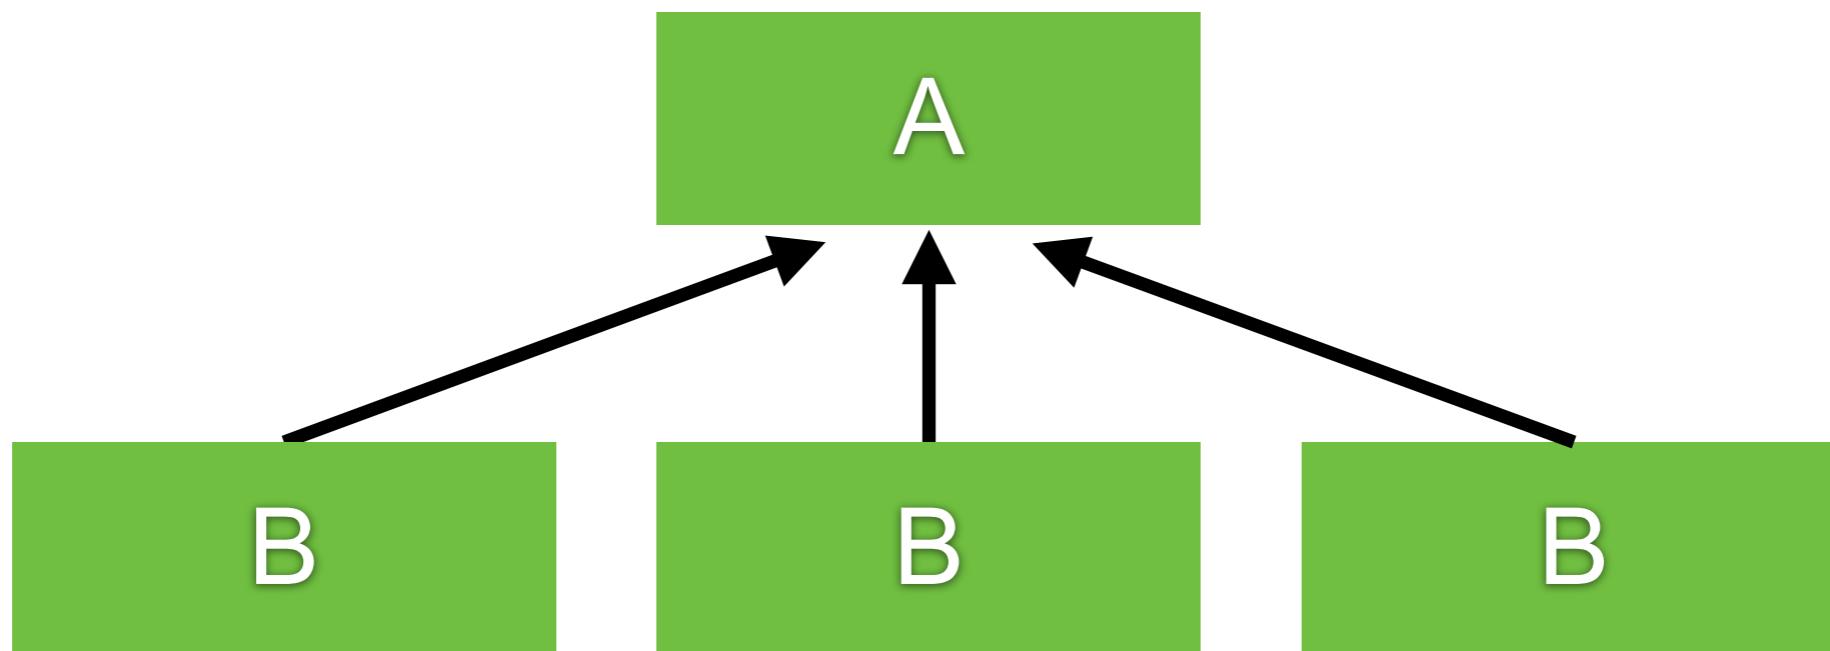

```
class BaseClass {  
}  
  
class SubClass extends BaseClass {  
}  
}
```

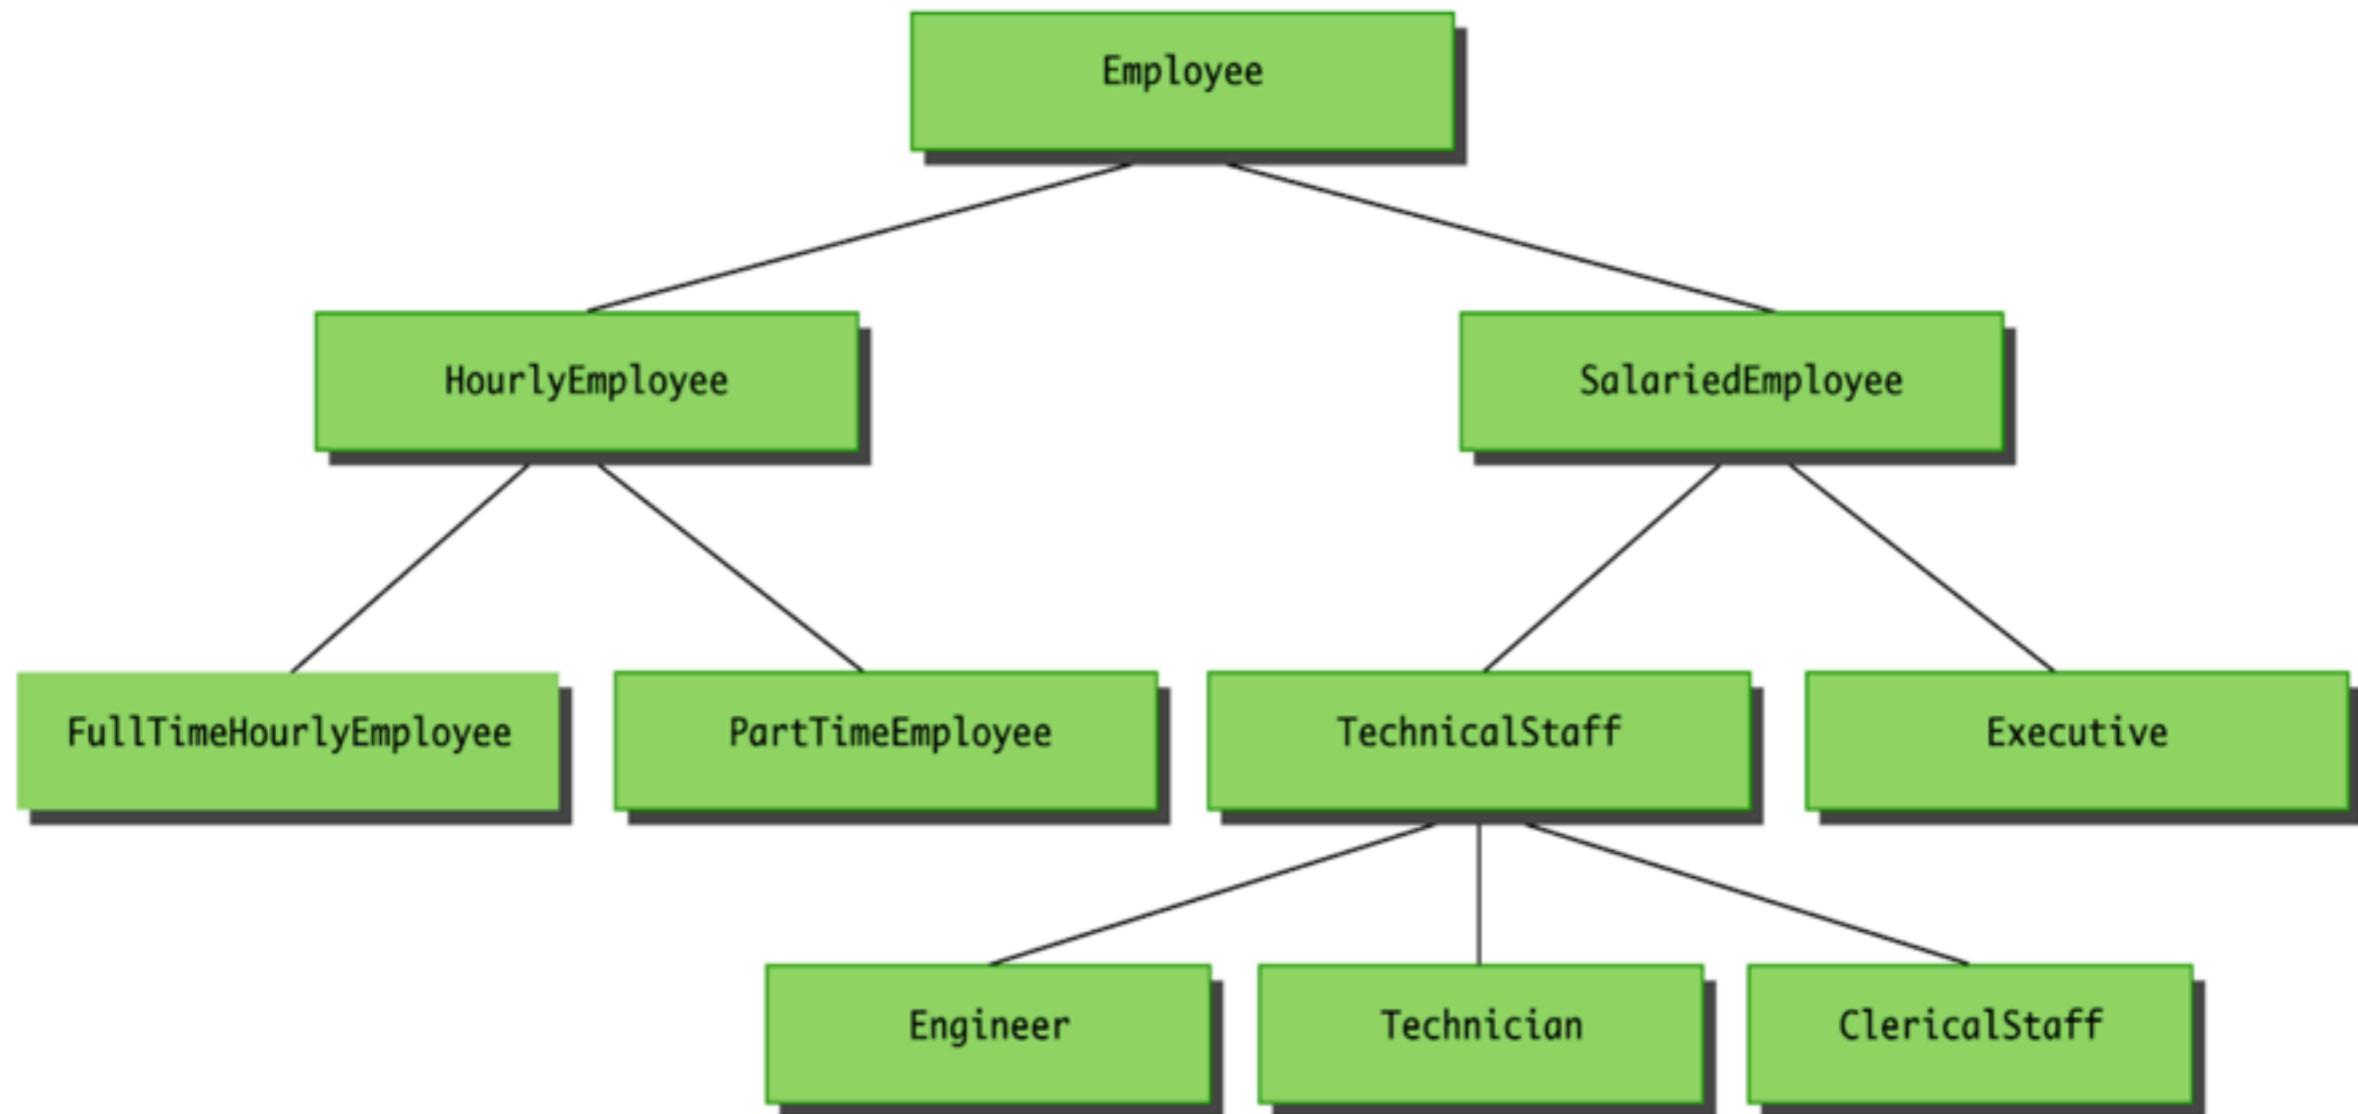

Multilevel Inheritance

Hierarchical Inheritance

Hierarchical Inheritance

More example with Employee

```
class Employee {  
  
    private int id;  
    protected String name;  
  
    protected void showName() {  
        System.out.println("Employee showName()");  
    }  
  
}
```

Create Manager class

Use super() to call superclass/base class

```
class Manager extends Employee {  
  
    @Override  
    protected void showName() {  
        super.showName();  
        System.out.println("Manager showName()");  
    }  
  
}
```

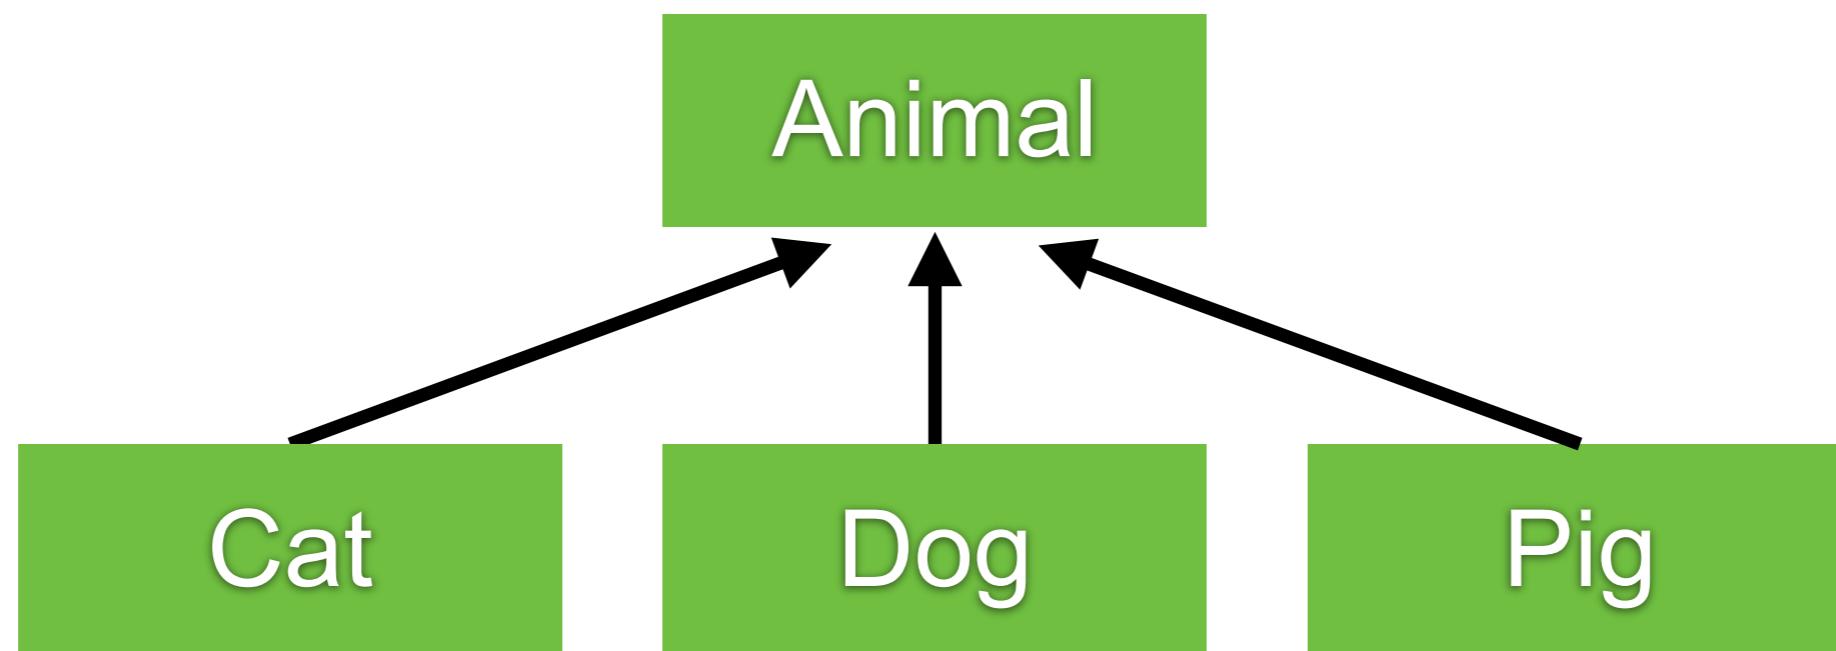

Visibility

| Visibility | Private | Default | Protected | Public |
|-----------------------------------|---------|---------|-----------|--------|
| Same class | Yes | Yes | Yes | Yes |
| Same package | No | Yes | Yes | Yes |
| Different package subclass | No | No | Yes | Yes |
| Different package non-subclass | No | No | No | Yes |

Animal Hierarchical

Animal class

```
class Animal {  
    public void speak(int i) {  
        System.out.println("Animal "+ i);  
    }  
}
```

Subclass class

```
class Cat extends Animal {  
    @Override  
    public void speak(int i) {  
        System.out.println("Cat "+ i);  
    }  
}  
  
class Dog extends Animal {  
    @Override  
    public void speak(int i) {  
        System.out.println("Dog "+ i);  
    }  
}  
  
class Pig extends Animal {  
    @Override  
    public void speak(int i) {  
        System.out.println("Pig "+ i);  
    }  
}
```

Animal in the Zoo

```
public class Zoo {  
  
    public static void main(String[] args) {  
        Cat cat = new Cat();  
        Dog dog = new Dog();  
        Pig pig = new Pig();  
  
        cat.speak(1);  
        dog.speak(2);  
        pig.speak(3);  
    }  
  
}
```

Animal in the Zoo

```
public class Zoo {  
    public static void main(String[] args) {  
        Cat cat = new Cat();  
        Dog dog = new Dog();  
        Pig pig = new Pig();  
  
        cat.speak(1);  
        dog.speak(2);  
        pig.speak(3);  
    }  
}
```

Problem with Zoo ?

Problem with Zoo

Contain type-specific in each type

What happen when add new type of Animal ?

We need the better code !!!

Solution

Called Polymorphism

```
public class Zoo {  
    public static void main(String[] args) {  
        Cat cat = new Cat();  
        Dog dog = new Dog();  
        Pig pig = new Pig();  
  
        speak(cat, 1);  
        speak(dog, 2);  
        speak(pig, 3);  
    }  
  
    public static void speak(Animal animal, int i) {  
        animal.speak(i);  
    }  
}
```

OOP with Java Part 2

Abstract classes
Interfaces

Abstract classes

Placeholder for a method that fully defined in a subclass

Class have abstract modifier

Method can have abstract modifier

Abstract method can't be private

Abstract method can't have body

“Class that contains an abstract method is called Abstract class”

Classes

*“Class that contains an abstract method is called
Abstract class”*

*“Class that not contains an abstract method is called
Concrete class”*

Abstract classes

```
abstract class Employee {  
    private int id;  
  
    public abstract double getSalary();  
  
    public boolean sameSalary(Employee other) {  
        return this.getSalary() == other.getSalary();  
    }  
}
```

Pitfall of abstract class

You can't create instances of an abstract class
Abstract class can only use to derive more classes

Purpose of abstract class

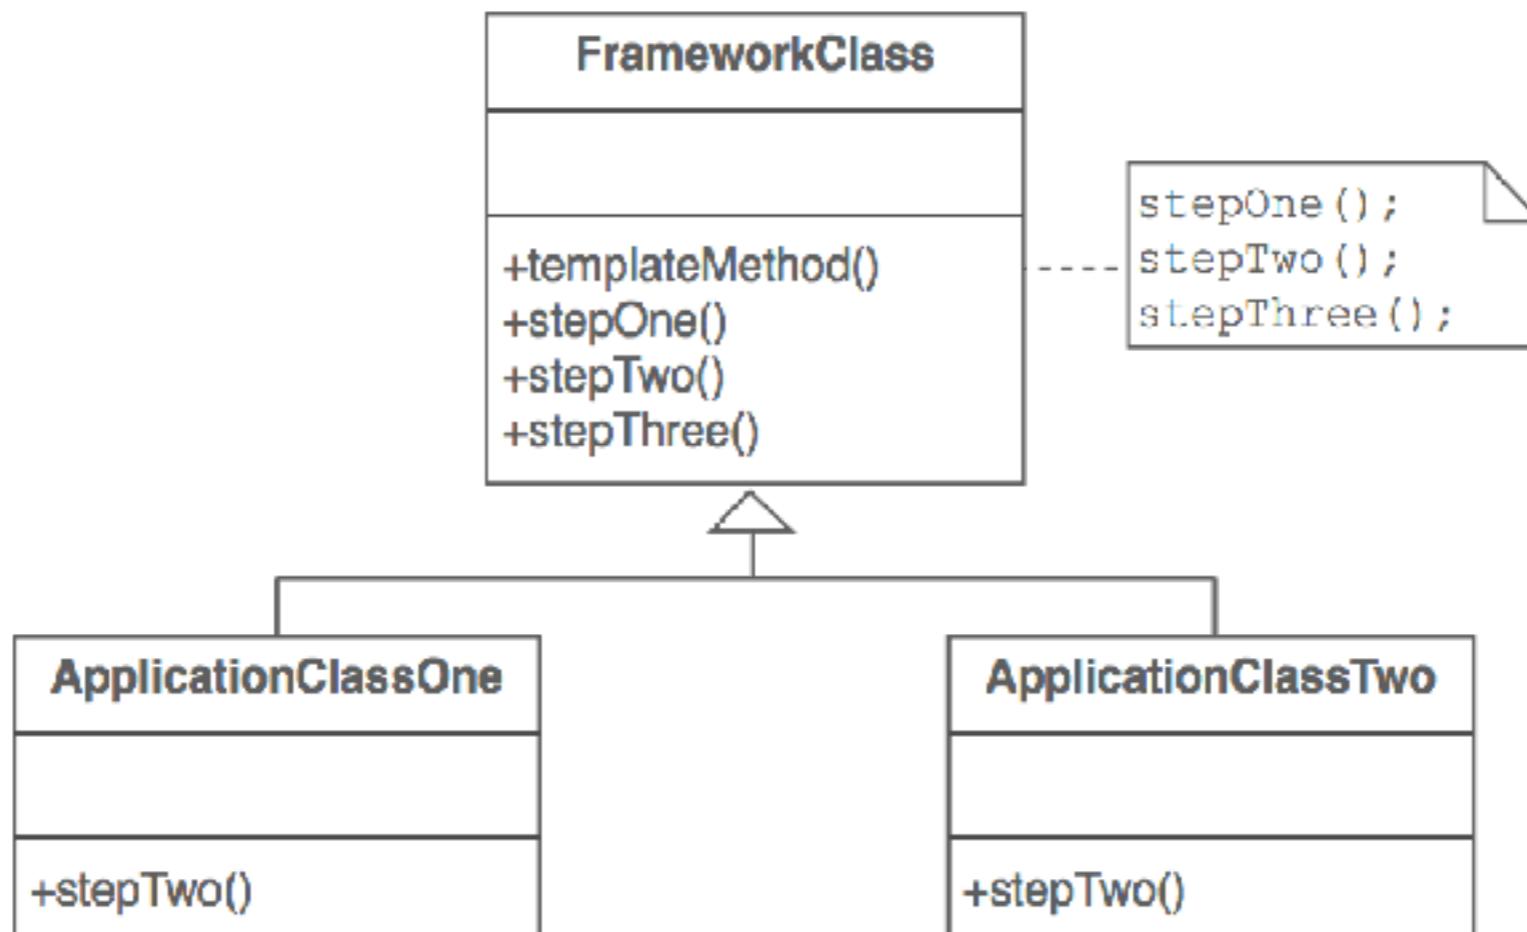

Create a function as base class
But can be extended by sub class

```
abstract class Report {  
    public abstract void createHeader();  
    public abstract void createBody();  
    public abstract void createFooter();  
  
    public void generate() {  
        createHeader();  
        createBody();  
        createFooter();  
    }  
}
```

Purpose of abstract class

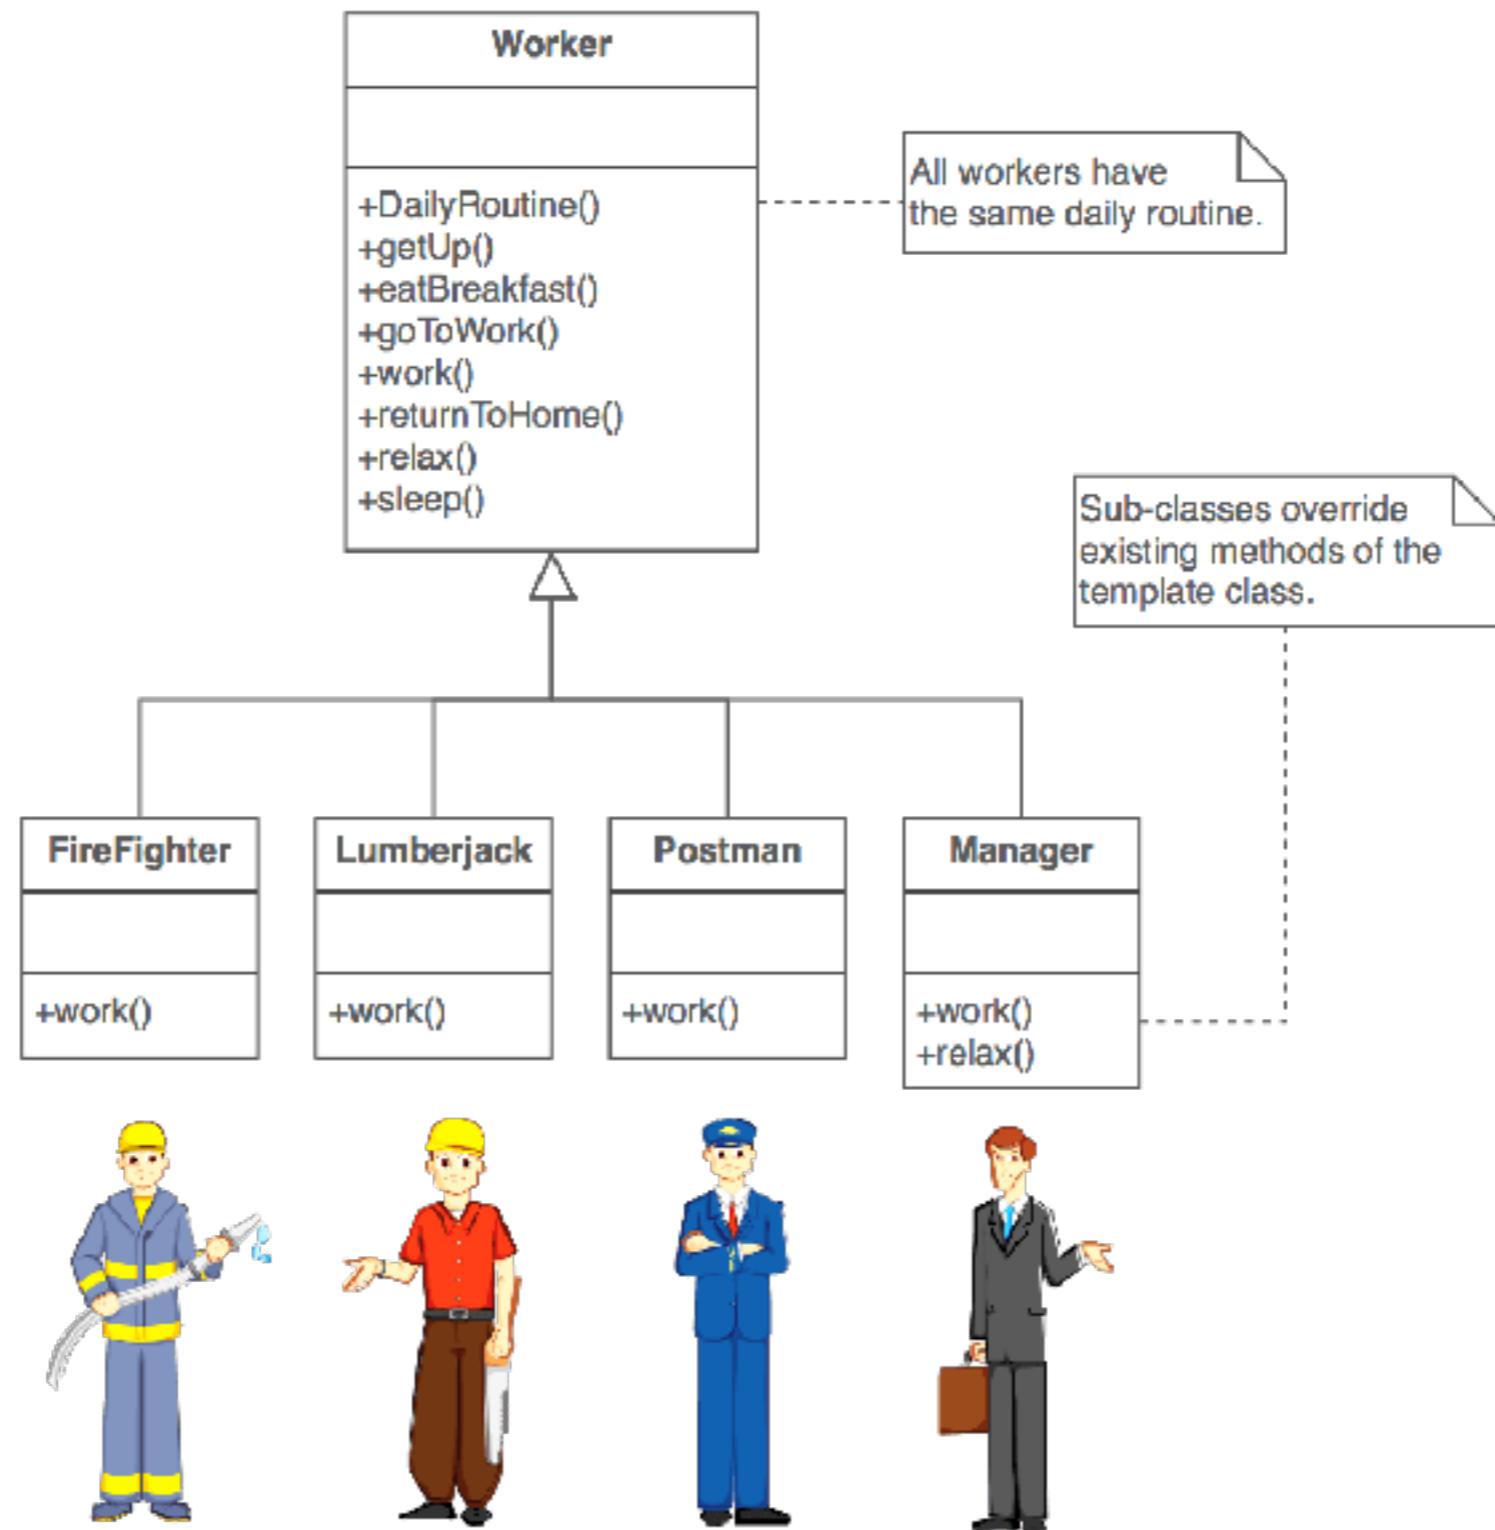

Template method design pattern

https://sourcemaking.com/design_patterns/template_method

Template method design pattern

Interfaces

Like an extreme abstract class

All of methods in an interface are abstract by default

Not a class

No instance variables

```
interface Animal {  
    void eat();  
    void sleep();  
}
```

Using interface from class (1)

```
class Cat implements Animal {
```

```
    @Override  
    public void eat() {  
    }
```

```
    @Override  
    public void sleep() {  
    }
```

```
}
```

Using interface from class (2)

```
class Cat implements Animal {
```

```
    @Override  
    public void eat() {  
    }
```

```
    @Override  
    public void sleep() {  
    }
```

Need to implements all method from interface

Multiple implements interfaces

Class can be implement multiple interfaces

```
interface Animal {  
    void eat();  
    void sleep();  
}
```

```
interface Animal2018 {  
    void die();  
}
```

Multiple implements interfaces

```
class BlackPanther implements Animal, Animal2018 {  
  
    @Override  
    public void die() {  
    }  
  
    @Override  
    public void eat() {  
    }  
  
    @Override  
    public void sleep() {  
    }  
  
}
```

Extending an interface

A new interface can add method definitions to existing interface by **extending** the old

```
interface Animal {  
    void eat();  
    void sleep();  
}
```

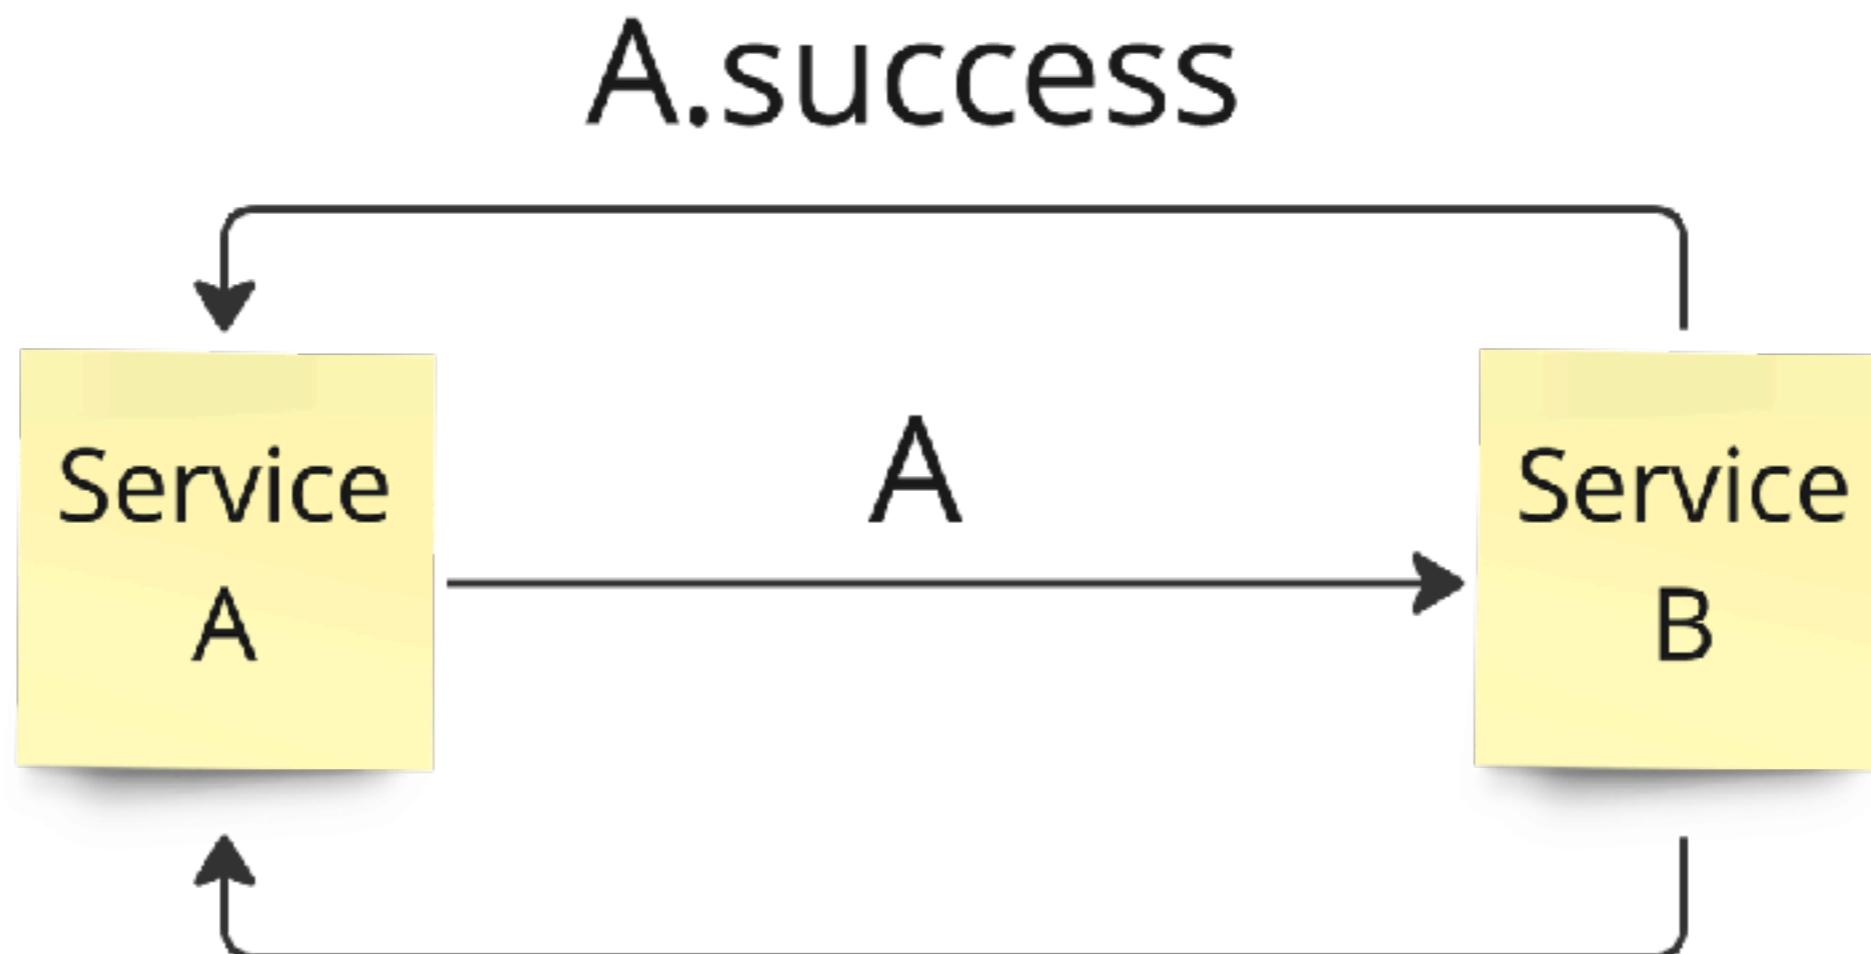

```
interface Animal2018 extends Animal {  
    void die();  
}
```

Callback with Interface

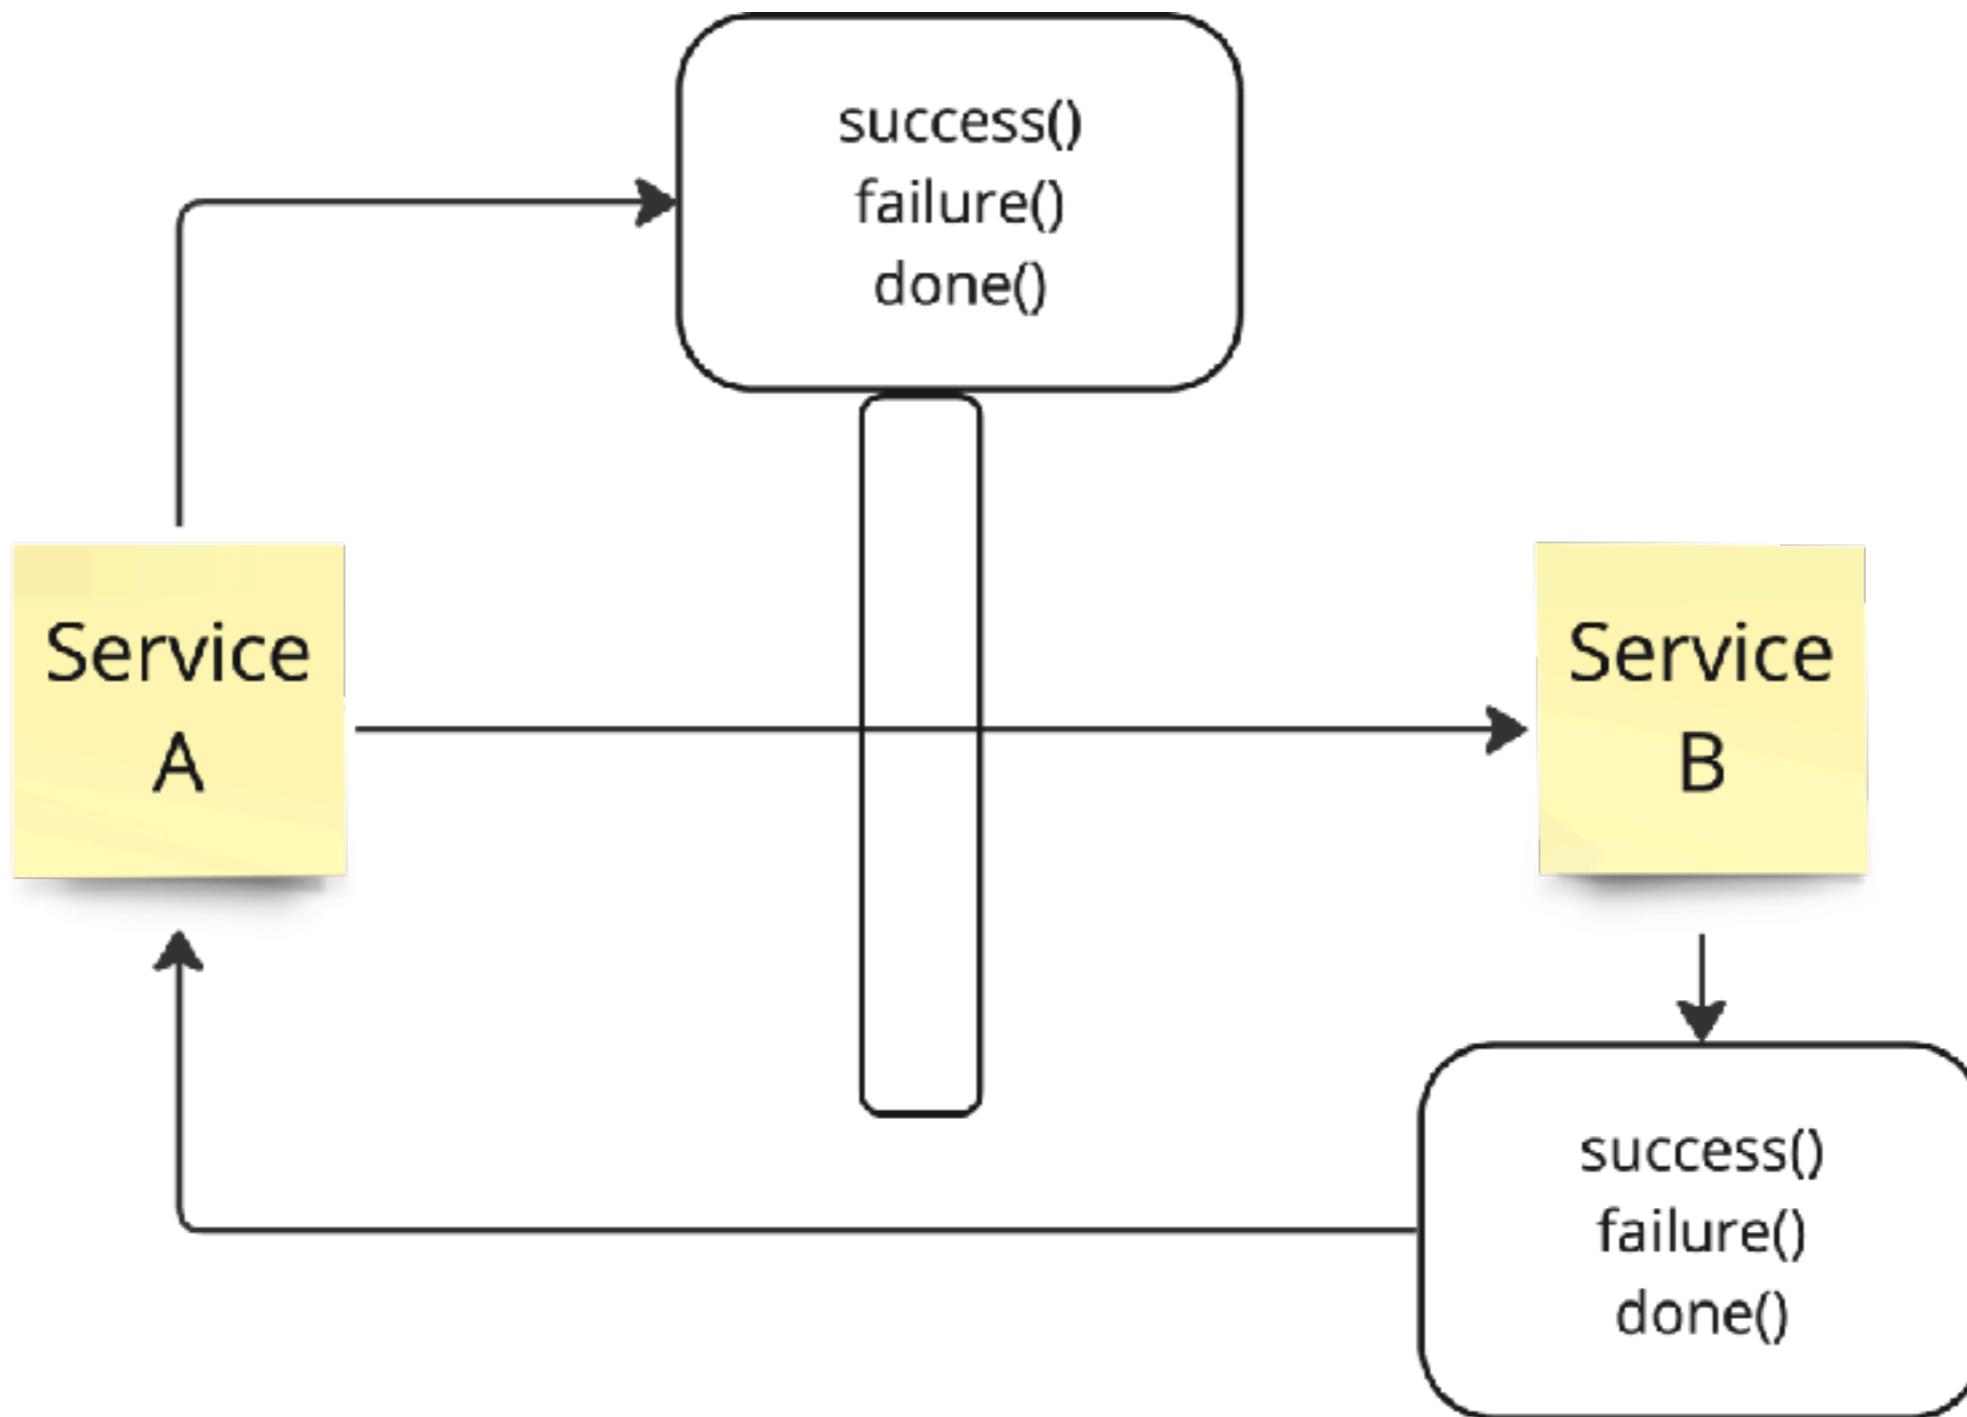

Call back with class

A.failure

Call back with interface

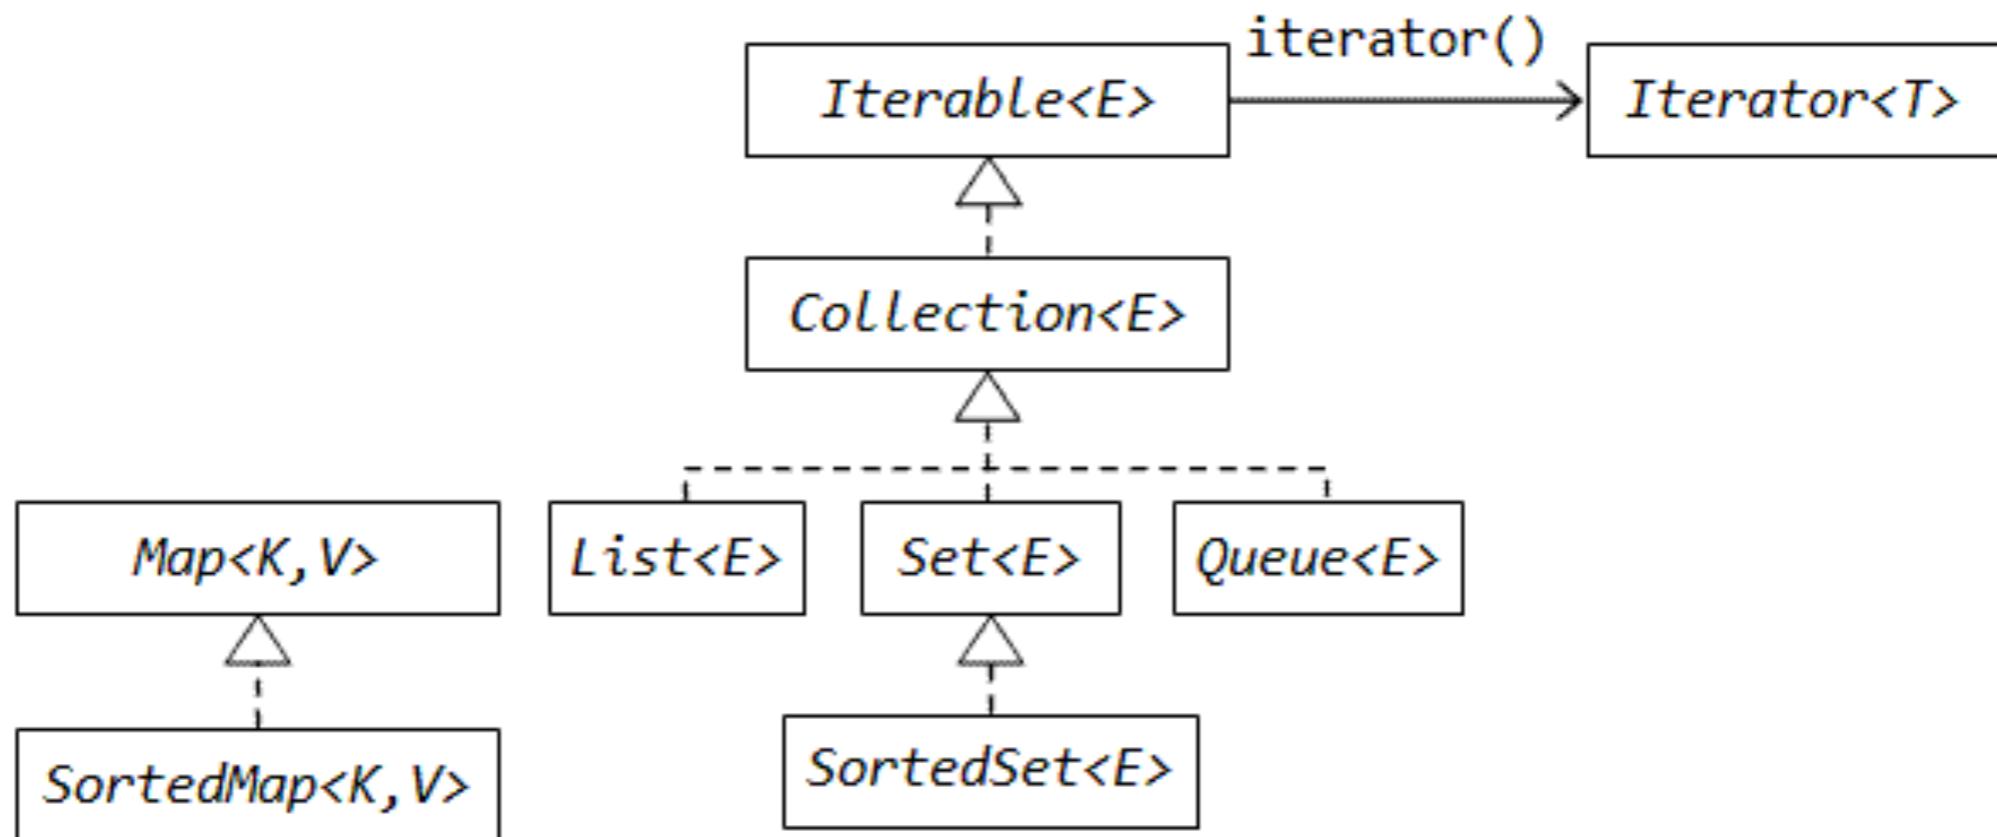

Java Collection Framework

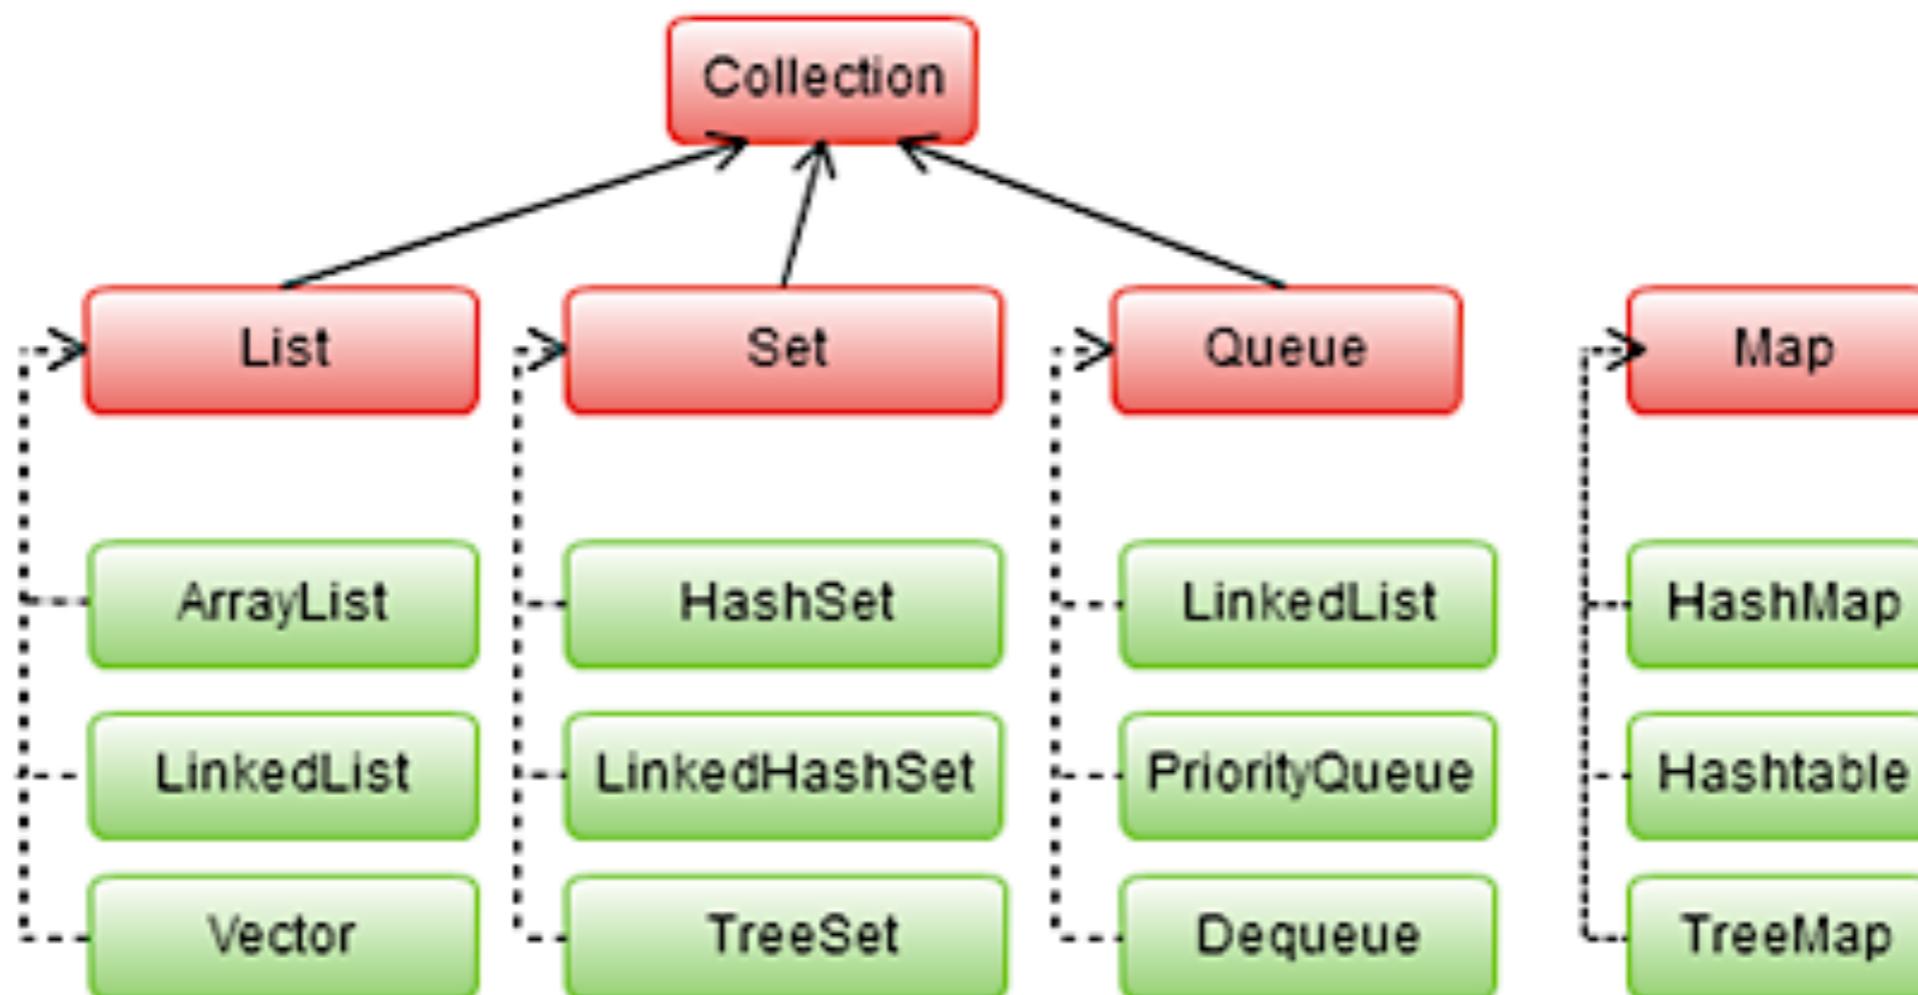

<https://docs.oracle.com/javase/8/docs/technotes/guides/collections/overview.html>

Java Collection Framework

Java Collection Framework

Java Collections Cheat Sheet

Notable Java collections libraries

Fastutil

<http://fastutil.di.unimi.it/>

Fast & compact type-specific collections for Java
Great default choice for collections of primitive types, like int or long. Also handles big collections with more than 2^{31} elements well.

Guava

<https://github.com/google/guava>

Google Core Libraries for Java 6+
Perhaps the default collection library for Java projects. Contains a magnitude of convenient methods for creating collection, like fluent builders, as well as advanced collection types.

Eclipse Collections

<https://www.eclipse.org/collections/>

Features you want with the collections you need
Previously known as gs-collections, this library includes almost any collection you might need: primitive type collections, multimap, bidirectional maps and so on.

JCTools

<https://github.com/JCTools/JCTools>

Java Concurrency Tools for the JVM.
If you work on high throughput concurrent applications and need a way to increase your performance, check out JCTools.

What can your collection do for you?

| Collection class | Thread-safe alternative | Your data | | | | Operations on your collections | | | | | | |
|---------------------------|---|---------------------|-----------------|---------------------------|-------------------|--------------------------------|--------|------|--------------------------|--------|----------|----------|
| | | Individual elements | Key-value pairs | Duplicate element support | Primitive support | FIFO | Sorted | LIFO | Perform 'contains' check | By key | By value | By index |
| HashMap | ConcurrentHashMap | ✗ | ✓ | ✗ | ✗ | ✗ | ✗ | ✗ | ✓ | ✓ | ✗ | ✗ |
| HashBiMap (Guava) | Maps.synchronizedBiMap (new HashBiMap()) | ✗ | ✓ | ✗ | ✗ | ✗ | ✗ | ✗ | ✓ | ✓ | ✓ | ✗ |
| ArrayListMultimap (Guava) | Maps.synchronizedMultiMap (new ArrayListMultimap()) | ✗ | ✓ | ✓ | ✗ | ✗ | ✗ | ✗ | ✓ | ✓ | ✗ | ✗ |
| LinkedHashMap | Collections.synchronizedMap (new LinkedHashMap()) | ✗ | ✓ | ✗ | ✗ | ✓ | ✗ | ✗ | ✓ | ✓ | ✗ | ✗ |
| TreeMap | ConcurrentSkipListMap | ✗ | ✓ | ✗ | ✗ | ✗ | ✓ | ✗ | ✓* | ✓* | ✗ | ✗ |
| Int2IntMap (Fastutil) | | ✗ | ✓ | ✗ | ✓ | ✗ | ✗ | ✗ | ✓ | ✓ | ✗ | ✓ |
| ArrayList | CopyOnWriteArrayList | ✓ | ✗ | ✓ | ✗ | ✓ | ✗ | ✓ | ✗ | ✗ | ✗ | ✓ |
| HashSet | Collections.newSetFromMap (new ConcurrentHashMap<>()) | ✓ | ✗ | ✗ | ✗ | ✗ | ✗ | ✗ | ✓ | ✗ | ✓ | ✗ |
| IntArrayList (Fastutil) | | ✓ | ✗ | ✓ | ✓ | ✓ | ✓ | ✗ | ✓ | ✗ | ✗ | ✓ |
| PriorityQueue | PriorityBlockingQueue | ✓ | ✗ | ✓ | ✗ | ✗ | ✓** | ✗ | ✗ | ✗ | ✗ | ✗ |
| ArrayDeque | ArrayBlockingQueue | ✓ | ✗ | ✓ | ✗ | ✓** | ✗ | ✓** | ✗ | ✗ | ✗ | ✗ |

* $O(\log n)$ complexity, while all others are $O(1)$ - constant time

** when using Queue interface methods: offer() / poll()

How fast are your collections?

| Collection class | Random access by index / key | Search / Contains | Insert |
|------------------|------------------------------|-------------------|--------------|
| ArrayList | $O(1)$ | $O(n)$ | $O(n)$ |
| HashSet | $O(1)$ | $O(1)$ | $O(1)$ |
| HashMap | $O(1)$ | $O(1)$ | $O(1)$ |
| TreeMap | $O(\log(n))$ | $O(\log(n))$ | $O(\log(n))$ |

Remember, not all operations are equally fast. Here's a reminder of how to treat the Big-O complexity notation:

$O(1)$ - constant time, really fast, doesn't depend on the size of your collection

$O(\log(n))$ - pretty fast, your collection size has to be extreme to notice a performance impact

$O(n)$ - linear to your collection size: the larger your collection is, the slower your operations will be

Types of Error in Java

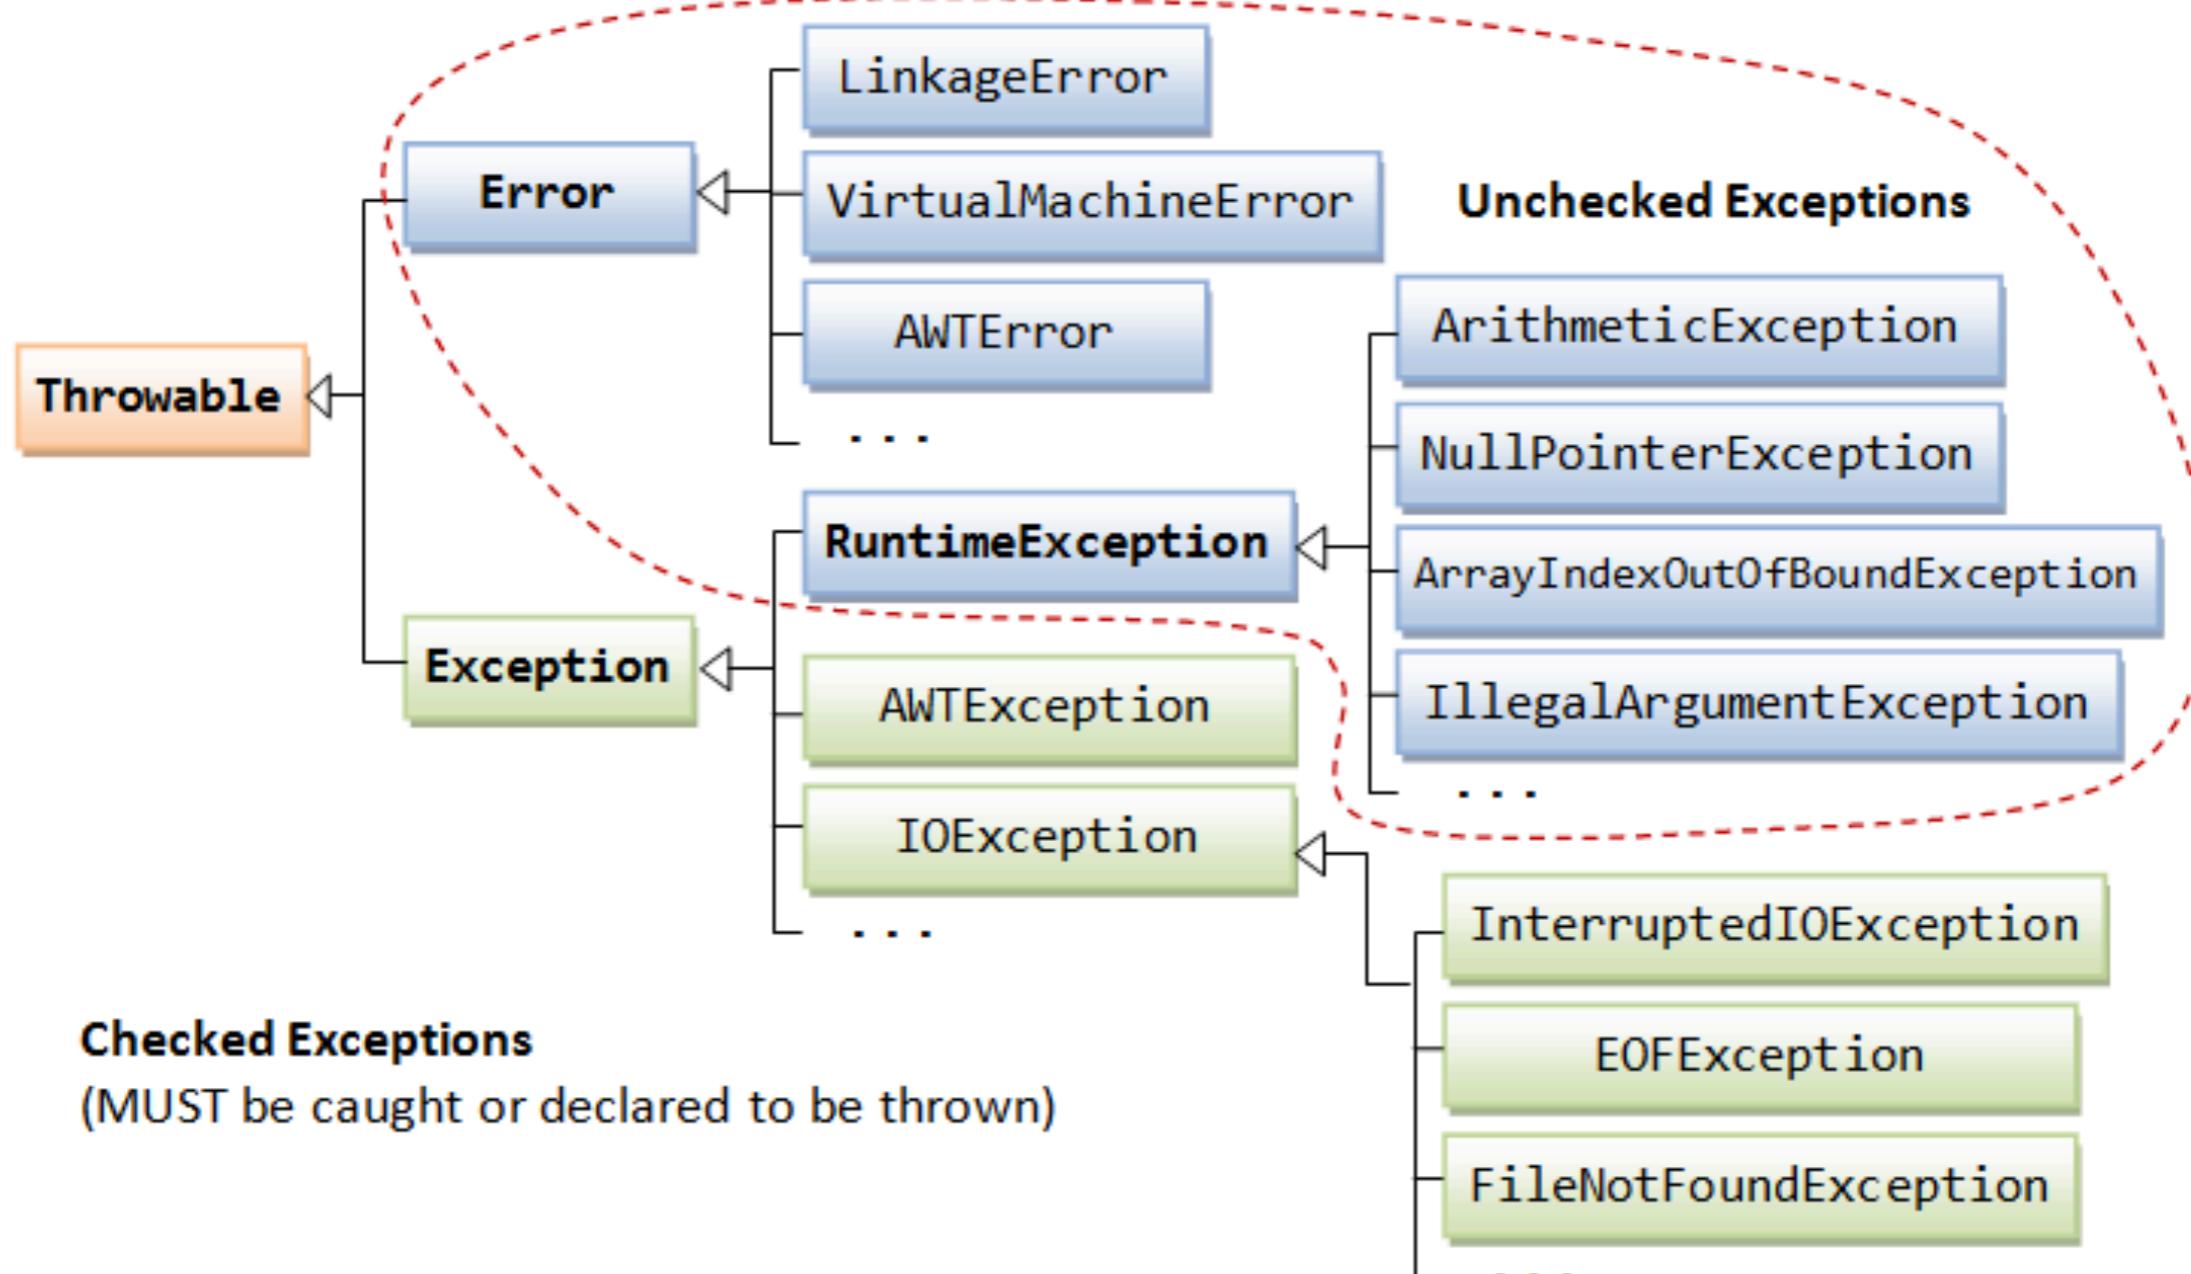

Types of Errors

- Compile-time errors
- Runtime errors
- Logical errors

Exception classes

Lambda expression

Java 8 Best Practices Cheat Sheet

BROUGHT TO YOU BY

Default methods

Evolve interfaces & create traits

```
// Default methods in interfaces
@FunctionalInterface
interface Utilities {
    default Consumer<Runnable> m() {
        return (r) -> r.run();
    }

    // default methods, still functional
    Object function(Object o);
}

class A implements Utilities { // implement
    public Object function(Object o) {
        return new Object();
    }

    // call a default method
    Consumer<Runnable> n = new A().m();
}
}
```

Traits: 1 default method per interface
Don't enhance functional interfaces
Only conservative implementations

Lambdas

Syntax:

```
(parameters) -> expression
(parameters) -> { statements; }
```

```
// takes a Long, returns a String
Function<Long, String> f = (l) -> l.toString();

// takes nothing gives you Threads
Supplier<Thread> s = Thread::currentThread;

// takes a string as the parameter
Consumer<String> c = System.out::println;

// use them with streams
new ArrayList<String>().stream();

// peek: debug streams without changes
peek(e -> System.out.println(e));

// map: convert every element into something
map(e -> e.hashCode());

// filter: pass some elements through
filter(e -> ((e.hashCode() % 2) == 0));

// collect all values from the stream
collect(Collectors.toCollection(TreeSet::new))
```

java.util. Optional

A container for possible null values

```
// Create an optional
Optional<String> optional =
Optional.ofNullable(a);

// process the optional
optional.map(s -> "RebellLabs:" + s);

// map a function that returns Optional
optional.flatMap(s -> Optional.ofNullable(s));

// run if the value is there
optional.ifPresent(System.out::println);

// get the value or throw an exception
optional.get();

// return the value or the given value
optional.orElse("Hello world!");

// return empty Optional if not satisfied
optional.filter(s -> s.startsWith("RebellLabs"));
```

Rules of Thumb

Expressions over statements
Refactor to use method references
Chain lambdas rather than growing them

Fields - use plain objects
Method parameters, use plain objects
Return values - use Optional
Use `orElse()` instead of `get()`

http://files.zeroturnaround.com/pdf/zt_java8_best_practices.pdf

Lambda expression

Functionality as a method arguments

Code as data

Help code more compact

Demo with Sorting data

Sorting data in List with Comparator

Employee id=1 name=First

Employee id=2 name=Second

Employee id=3 name=Third

Create class Employee

```
class Employee {  
    private int id;  
    private String name;  
    private double salary;  
  
    //Setter and Getter methods
```

Sorting with java.util.Comparator

```
Comparator<Employee> sortByName = new Comparator<Employee>() {  
    @Override  
    public int compare(Employee e1, Employee e2) {  
        return e1.getName().compareTo(e2.getName());  
    }  
};
```

Using with Collections.sort()

```
List<Employee> list = new ArrayList<>();
list.add(new Employee(500, "First", 150000));
list.add(new Employee(504, "Second", 120000));
list.add(new Employee(503, "Third", 100000));
list.add(new Employee(730, "Forth", 45000));

Collections.sort(list, sortByName);
list.forEach(System.out::println);
```

Run and see output

```
demo.java8.lambda.Employee@e9e54c2  
demo.java8.lambda.Employee@65ab7765  
demo.java8.lambda.Employee@1b28cdfa  
demo.java8.lambda.Employee@eed1f14
```

*Try to improve format of output !!
more readable*

Override `toString()`

```
class Employee {  
    private int id;  
    private String name;  
    private double salary;  
  
    @Override  
    public String toString() {  
        return "Employee [id=" + id + ", name=" + name + ", salary=" +  
salary + "]";  
    }  
}
```

```
Employee [id=500, name=First, salary=150000.0]  
Employee [id=504, name=Second, salary=120000.0]  
Employee [id=503, name=Third, salary=100000.0]  
Employee [id=730, name=Forth, salary=45000.0]
```

Sorting with Lambda expression

```
Comparator<Employee> sortByNameWithLambda =  
    (Employee e1, Employee e2) ->  
        e1.getName().compareTo(e2.getName());  
  
Collections.sort(list, sortByName);  
list.forEach(System.out::println);
```

Workshop

Sort by name (Z to A)

Sort by ID (0 to 9)

Java Stream API

Java Stream API

A new package **java.util.stream**
New functionality which contains classes for
processing sequences of elements

Java Stream API

Working with List and Array

```
String[] datas = new String[] {"P", "U", "I"};
Stream<String> streams = Arrays.stream(datas);
streams.forEach(System.out::println);
```

```
Stream<String> streams2 = Stream.of("P", "U", "I");
streams2.forEach(System.out::println);
```

Java Stream API

Sequential and Parallel

```
List<String> myList = Arrays.asList("P", "U", "I");
```

```
myList.stream().forEach(System.out::println);
```

```
myList.parallelStream().forEach(System.out::println);
```

Operations

Iterating
Filtering
Mapping
Matching
Collecting

Iterating

```
myList.stream().forEach(System.out::println);
```

Filtering

```
myList.stream()  
    .filter(element -> element.contains("P"))  
    .forEach(System.out::println);
```

Matching

Try to validate all elements of sequence

```
boolean isValid = myList.stream()  
    .anyMatch(element -> element.contains("P"));  
  
out.println(isValid);
```

Mapping

Try to convert elements by apply a special function

```
List<String> results =  
    myList.stream().map(element -> element.toLowerCase())  
        .collect(Collectors.toList());  
  
out.println(results);
```

Collecting

Try to convert stream to collection or map

```
List<String> results =  
    myList.stream().map(element -> element.toLowerCase())  
        .collect(Collectors.toList());  
  
out.println(results);
```

Automated testing with Java

Automation test

Unit test

<https://less.works/less/technical-excellence/unit-testing.html>

Purpose of Unit test

Facilitates changes
Simplified integration
Documentation
Design tool

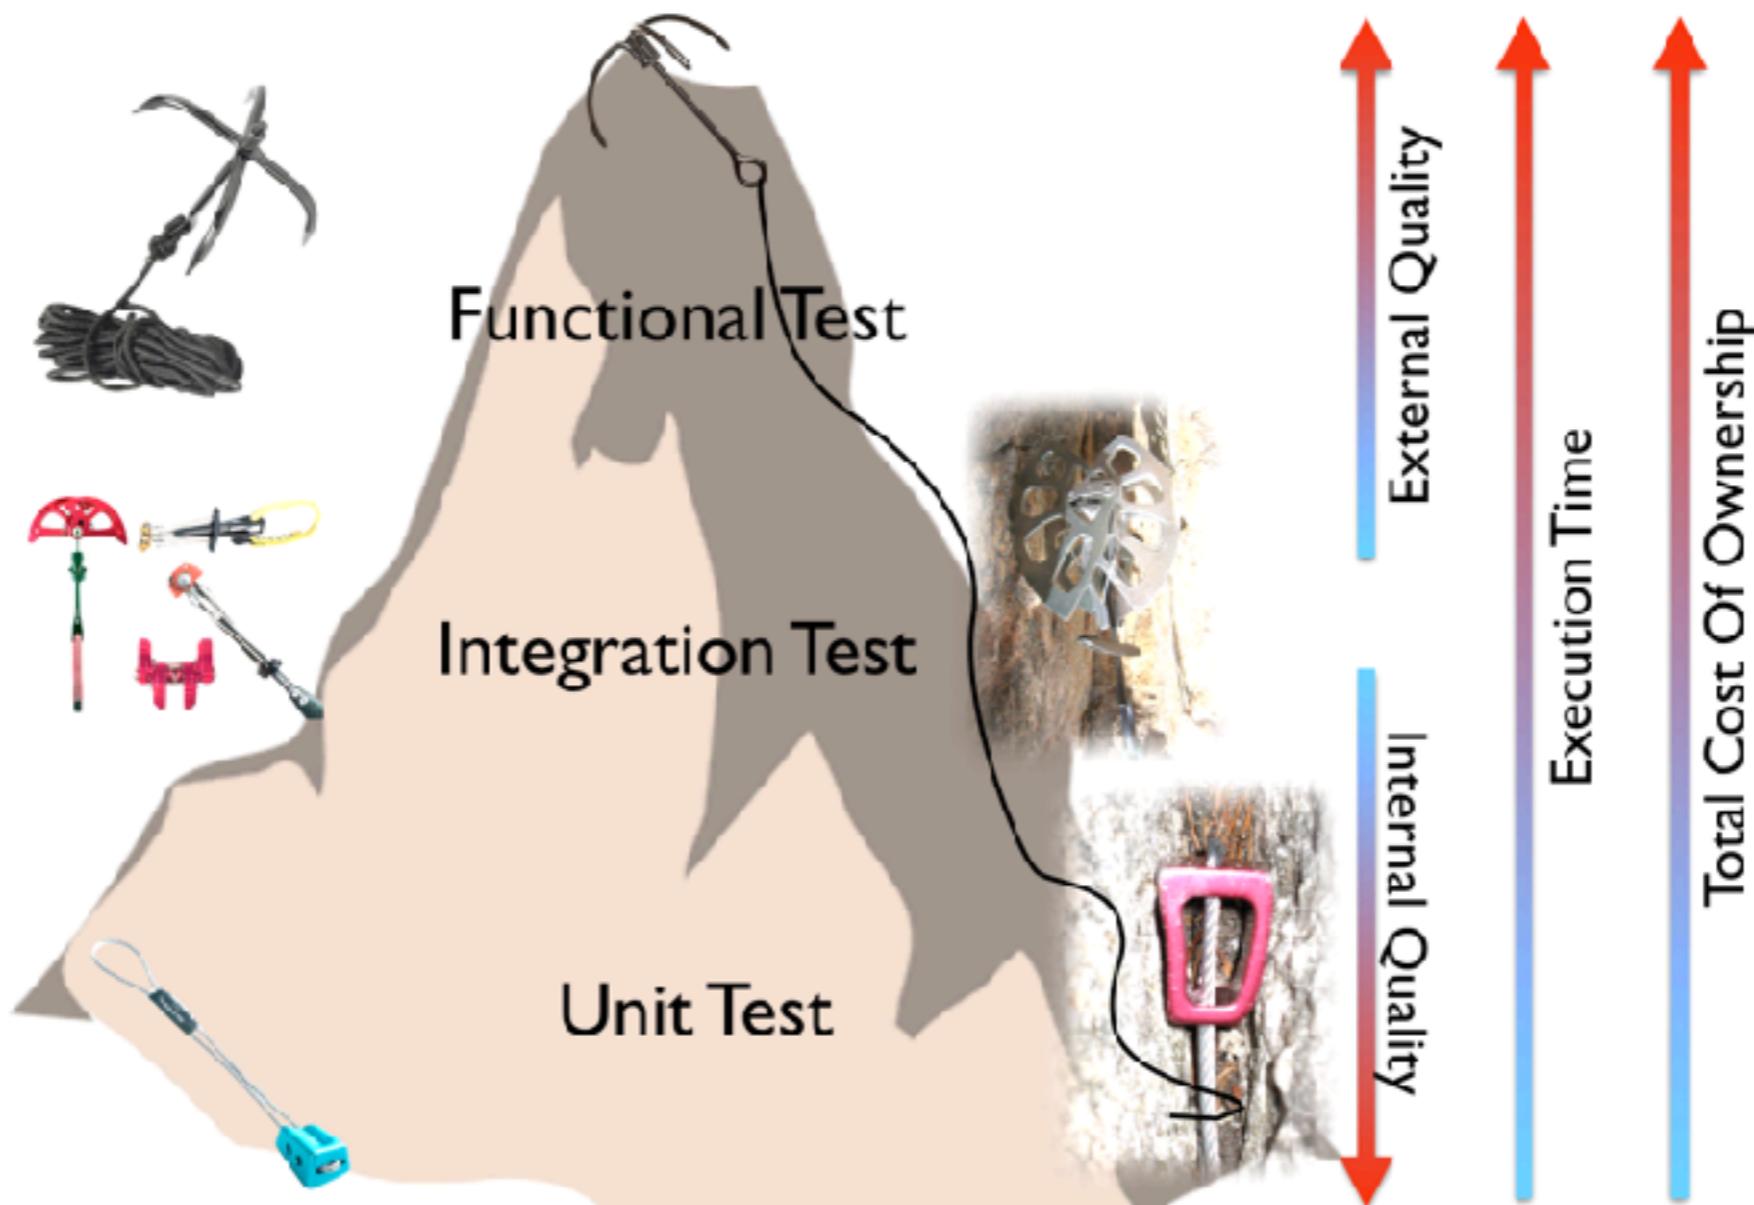

Why Unit test ?

Total cost of ownership
Internal vs External quality
Quality of feedback

Quality of feedback

<https://less.works/less/technical-excellence/unit-testing.html>

Golden rule of Unit test

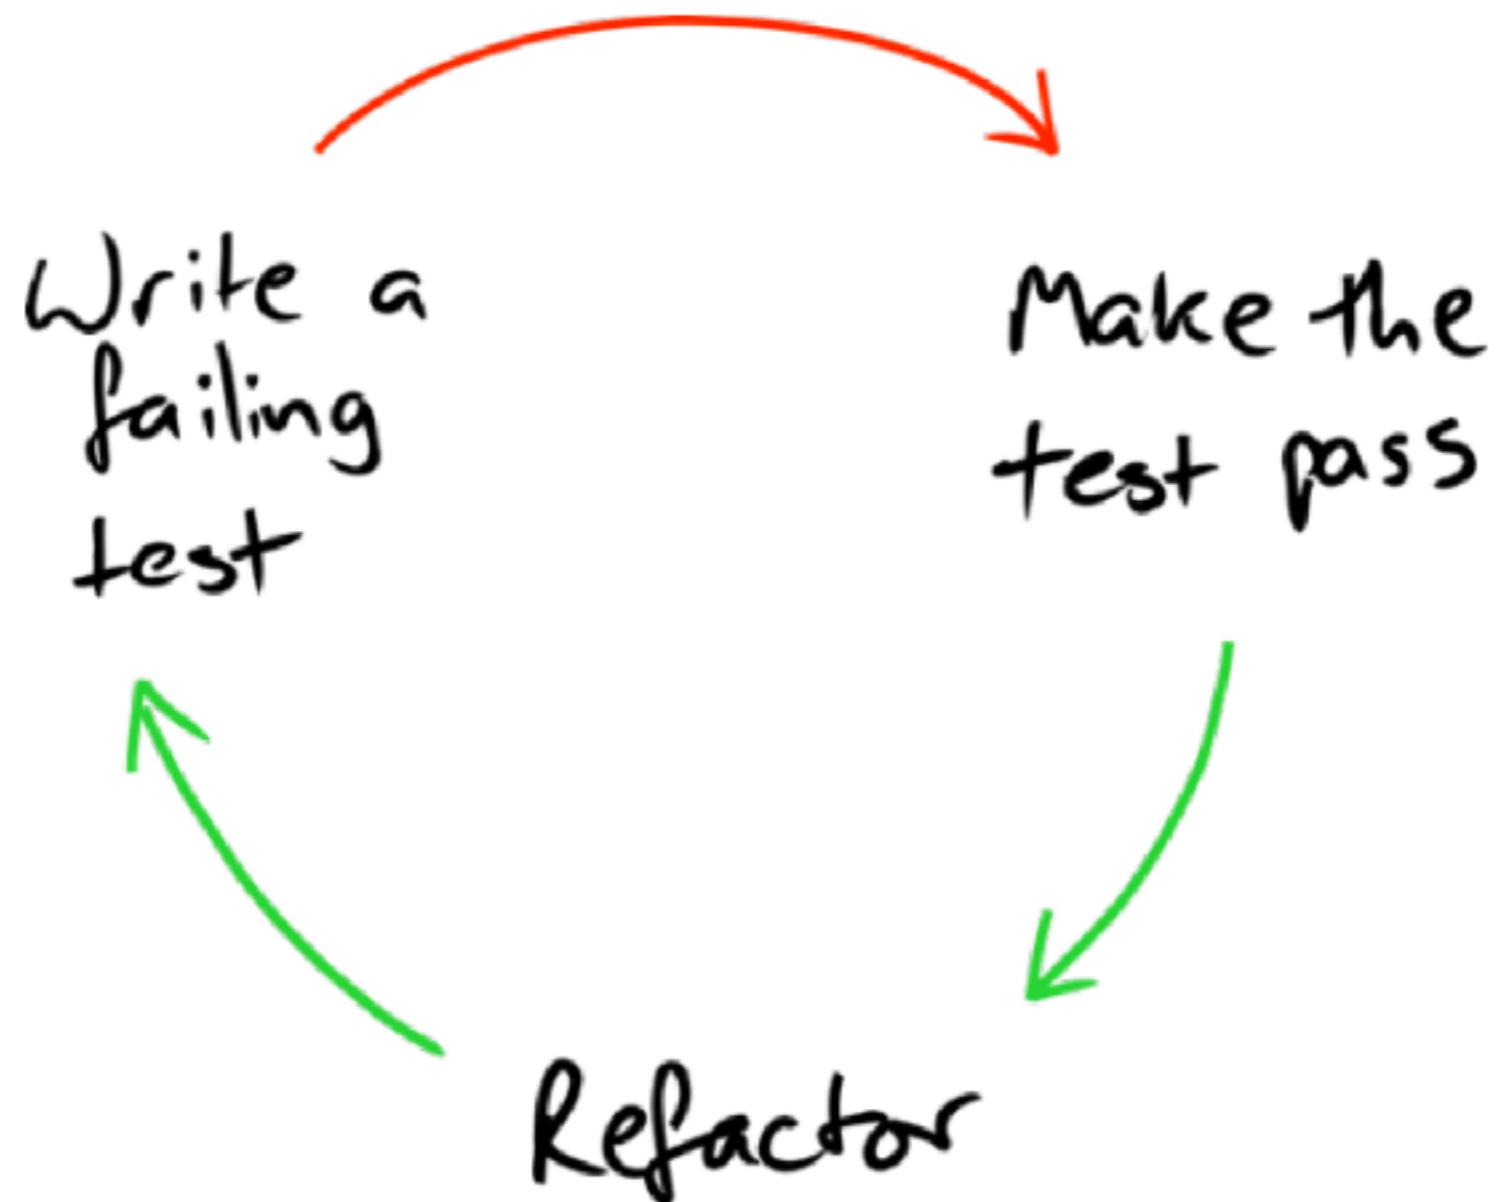

“Each unit test case
should be **very limited** in scope”

Test-Driven Development (TDD)

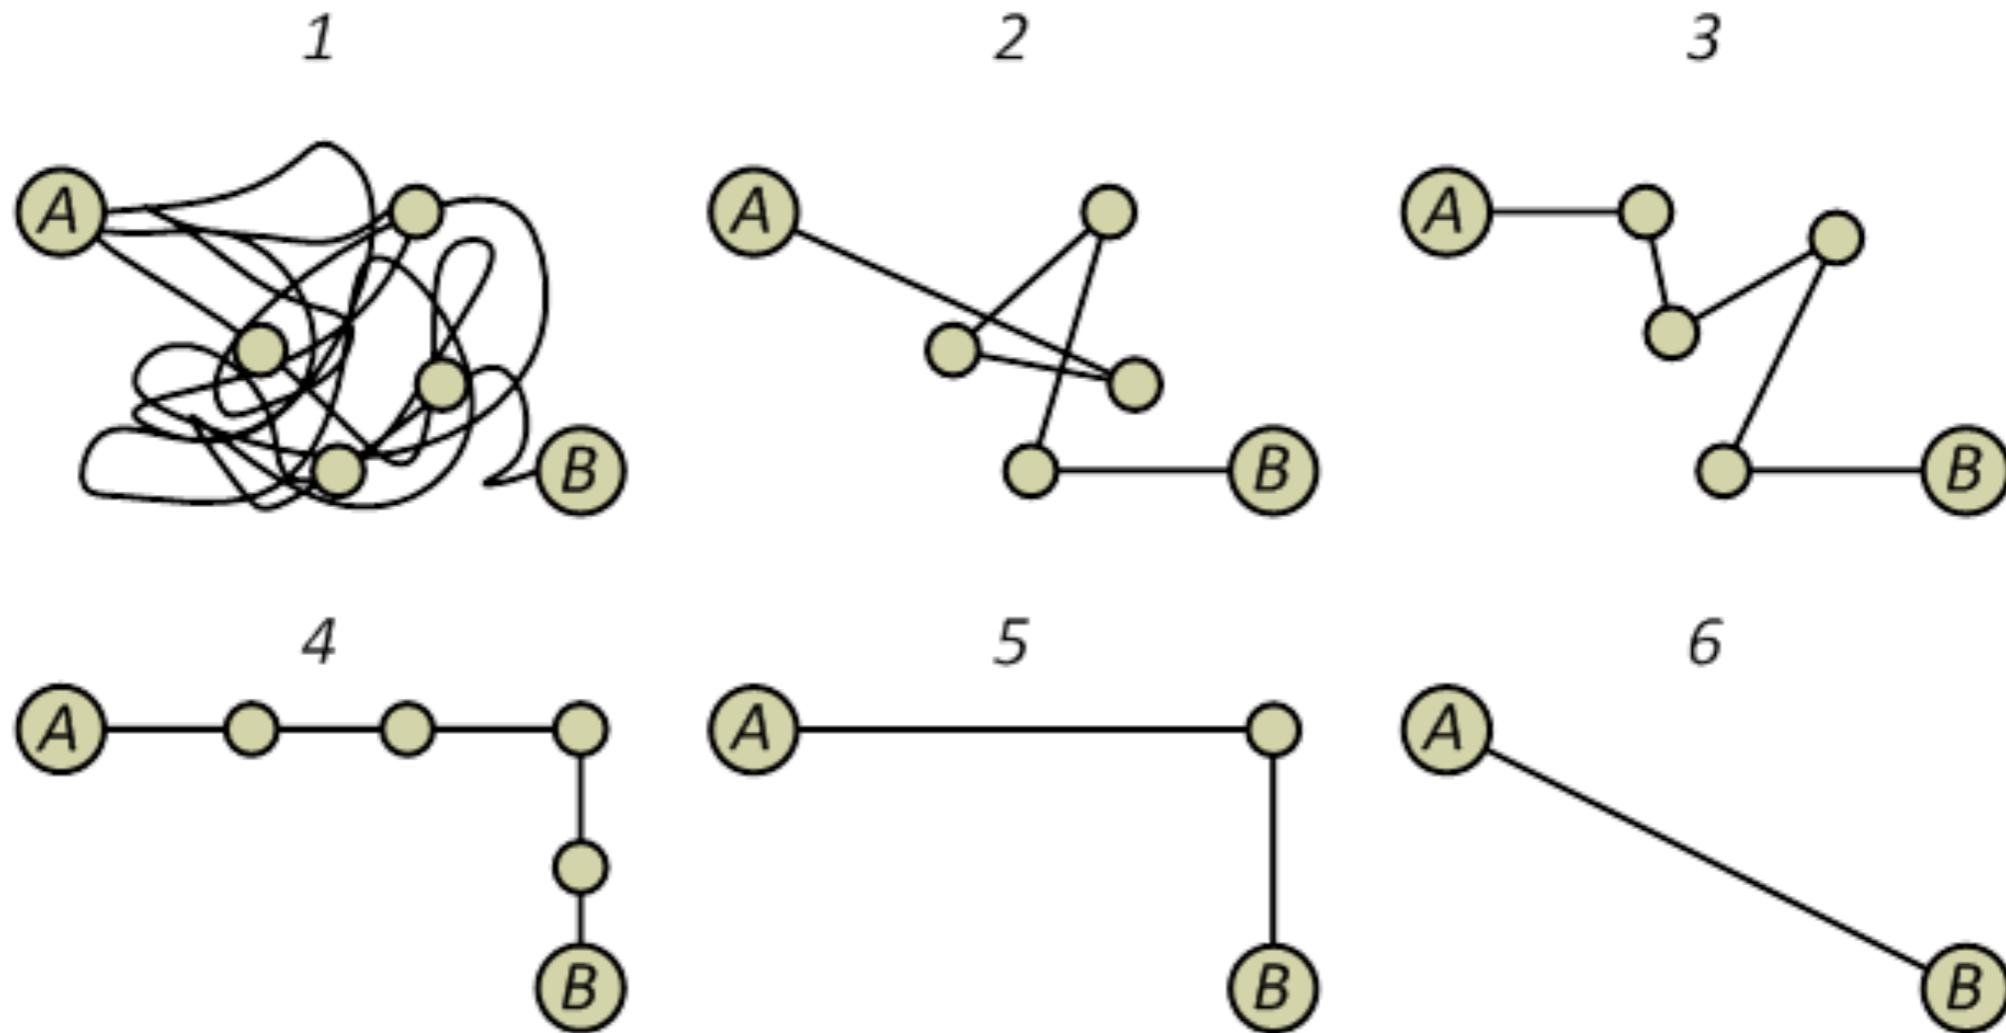

TDD Cycle

Refactor

Change the structure of code without change the behaviour of code

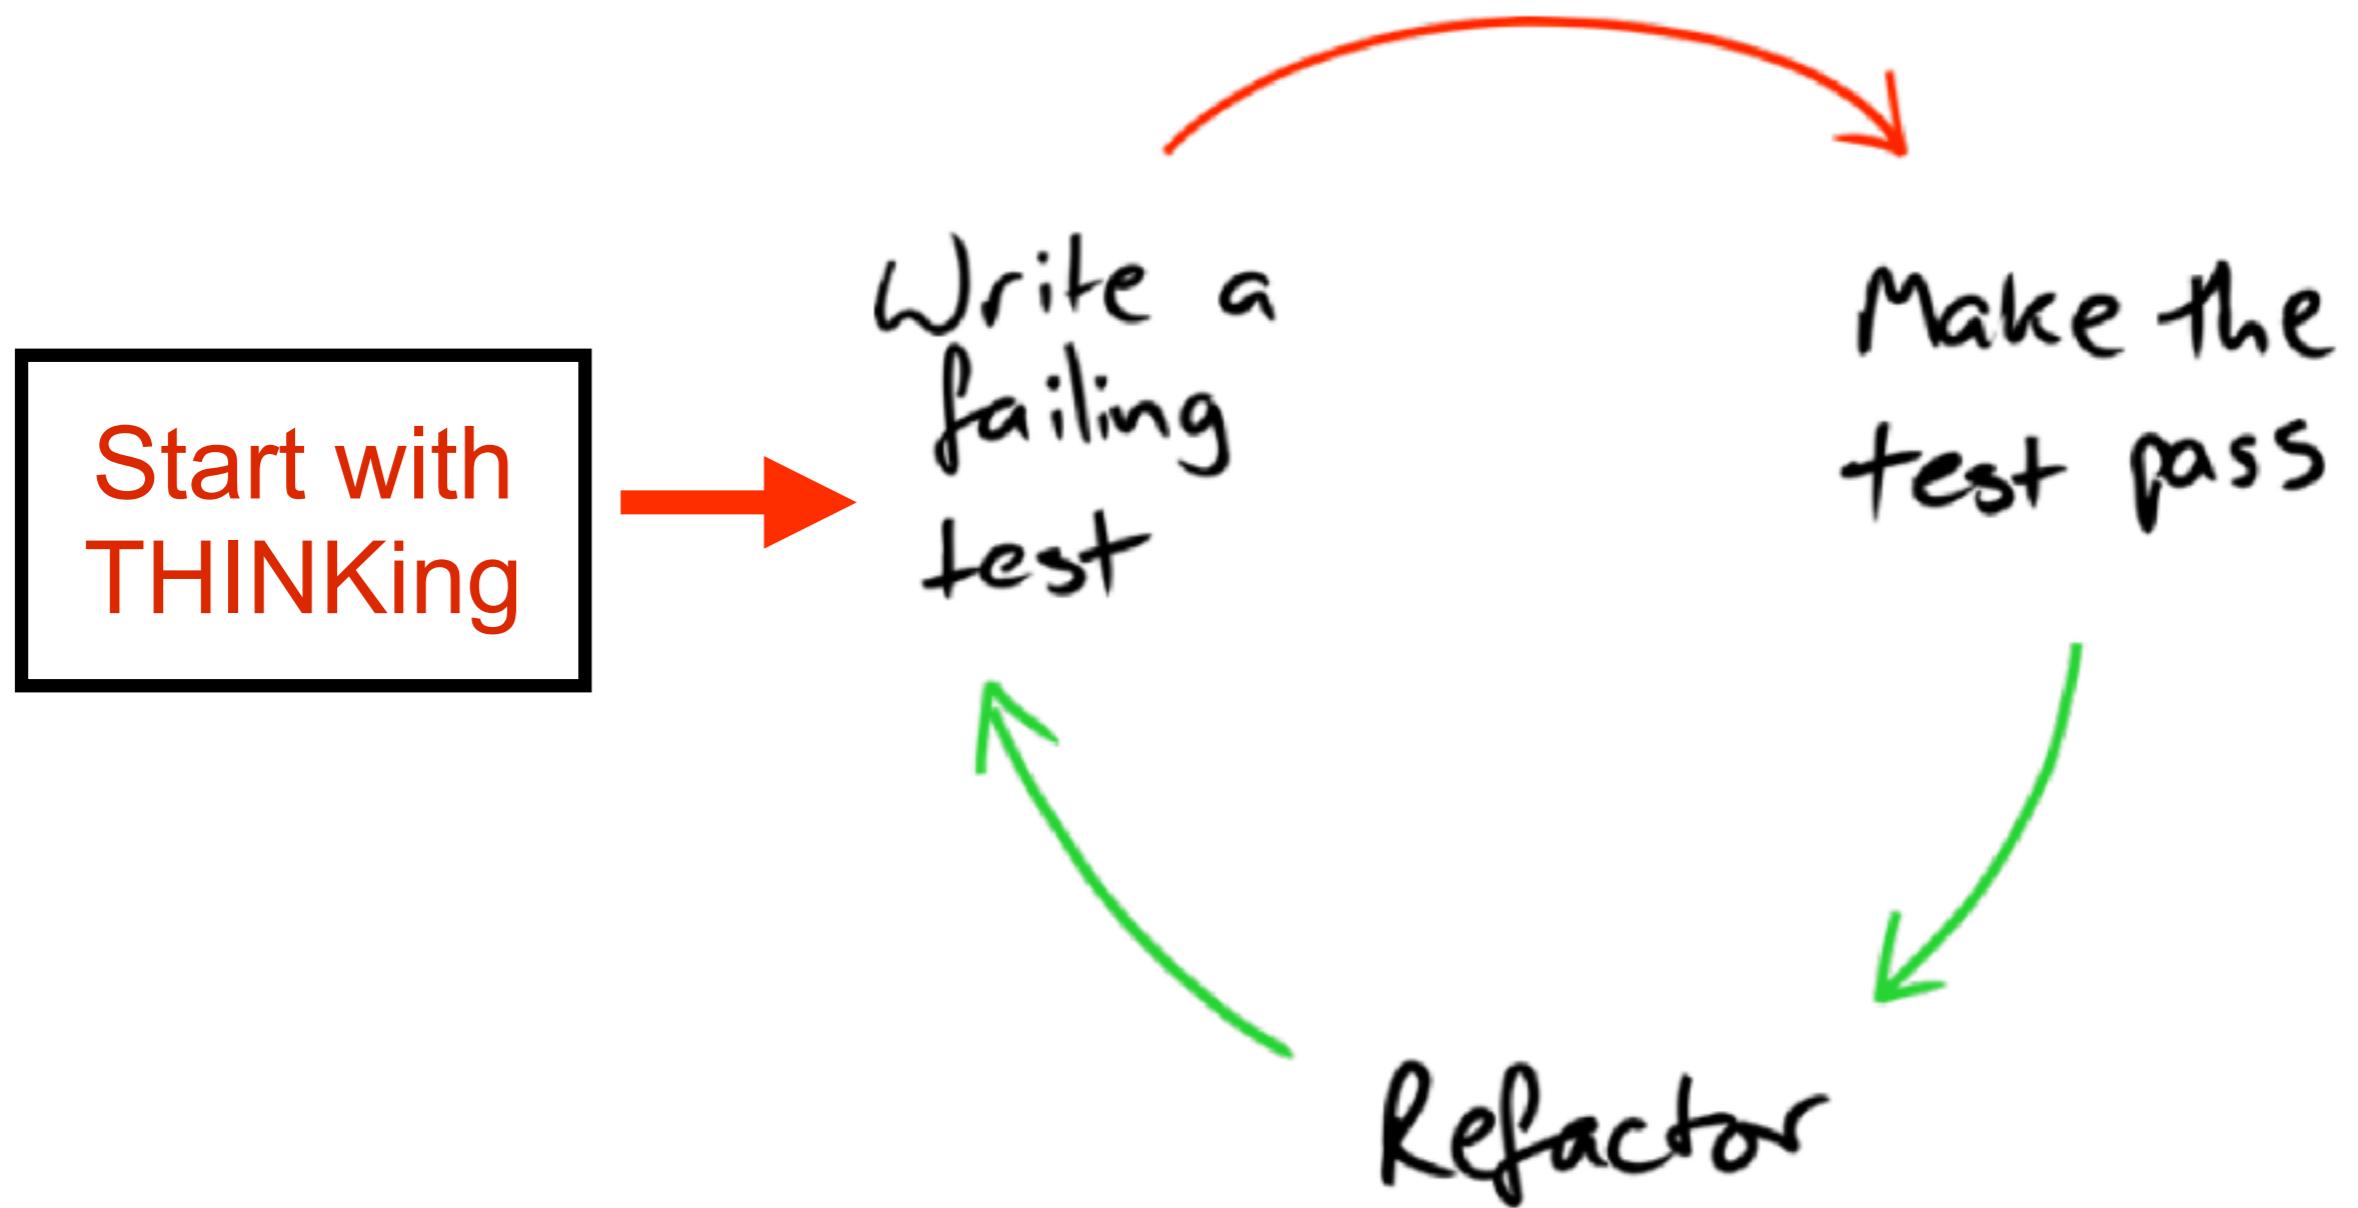

Simple Rule of TDD

1. Write a failing test before write any code
2. Remove duplication code

TDD Cycle

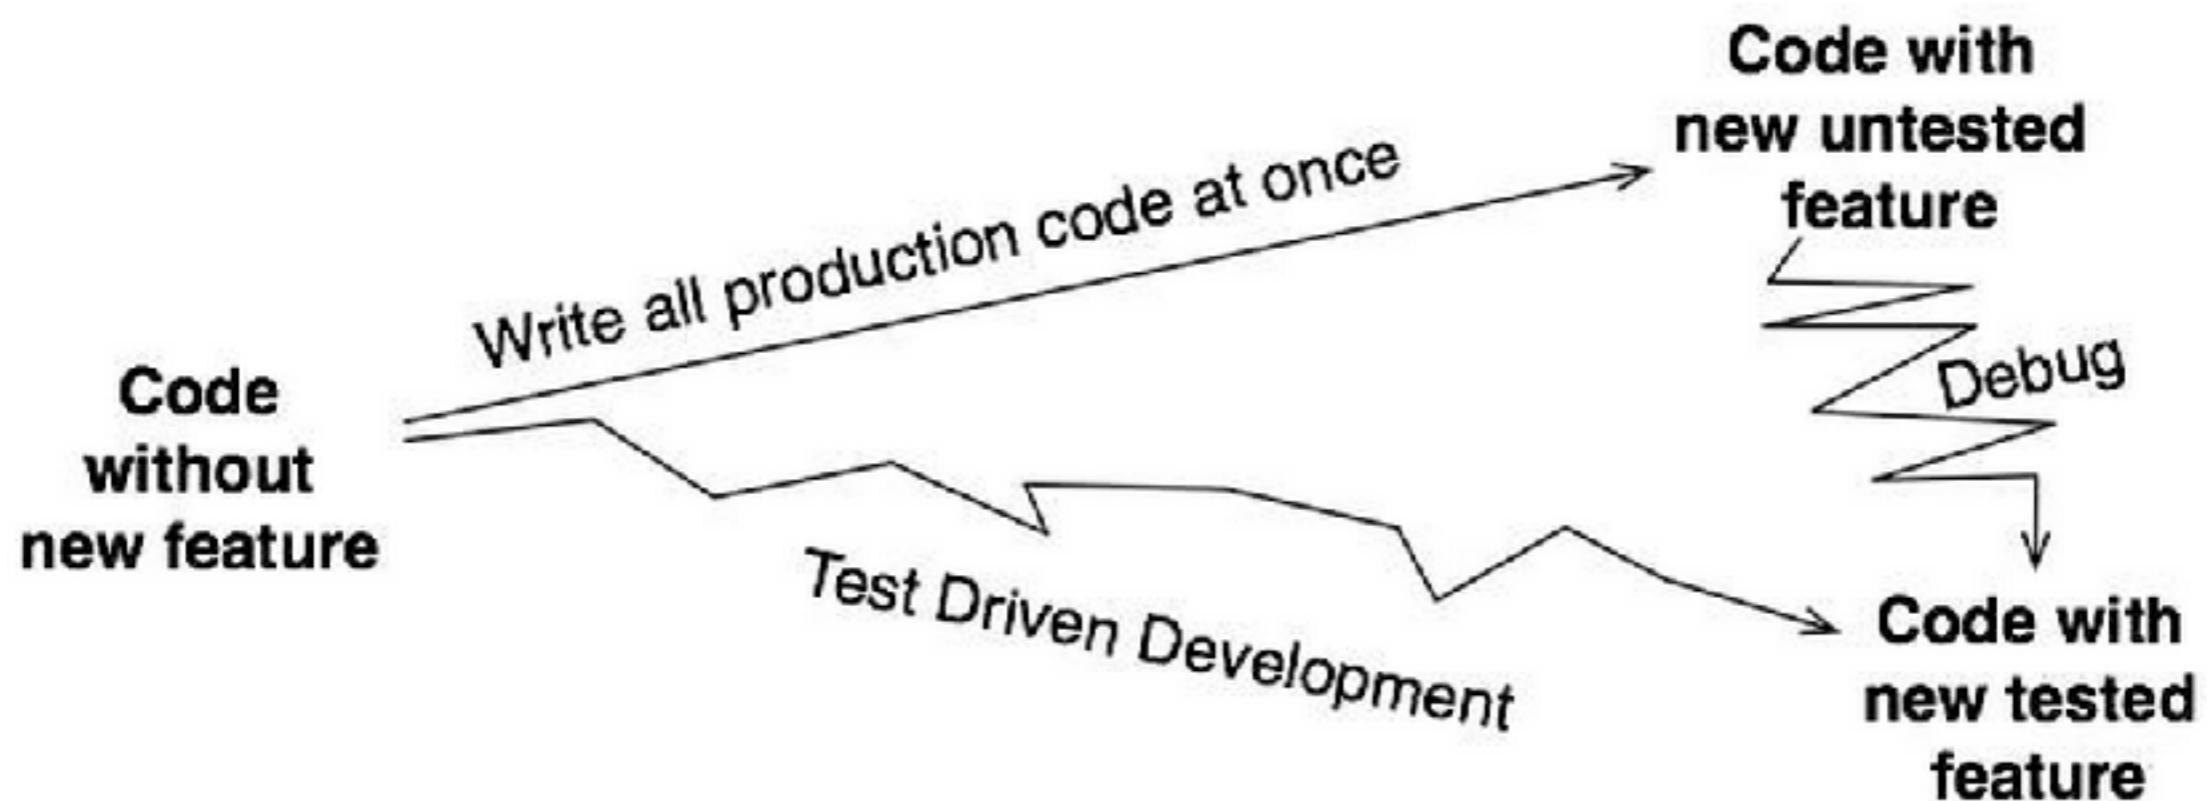

TDD cycle should be

Short
Rhythmic
Incremental
Design-focus
Discipline

TDD with DLP

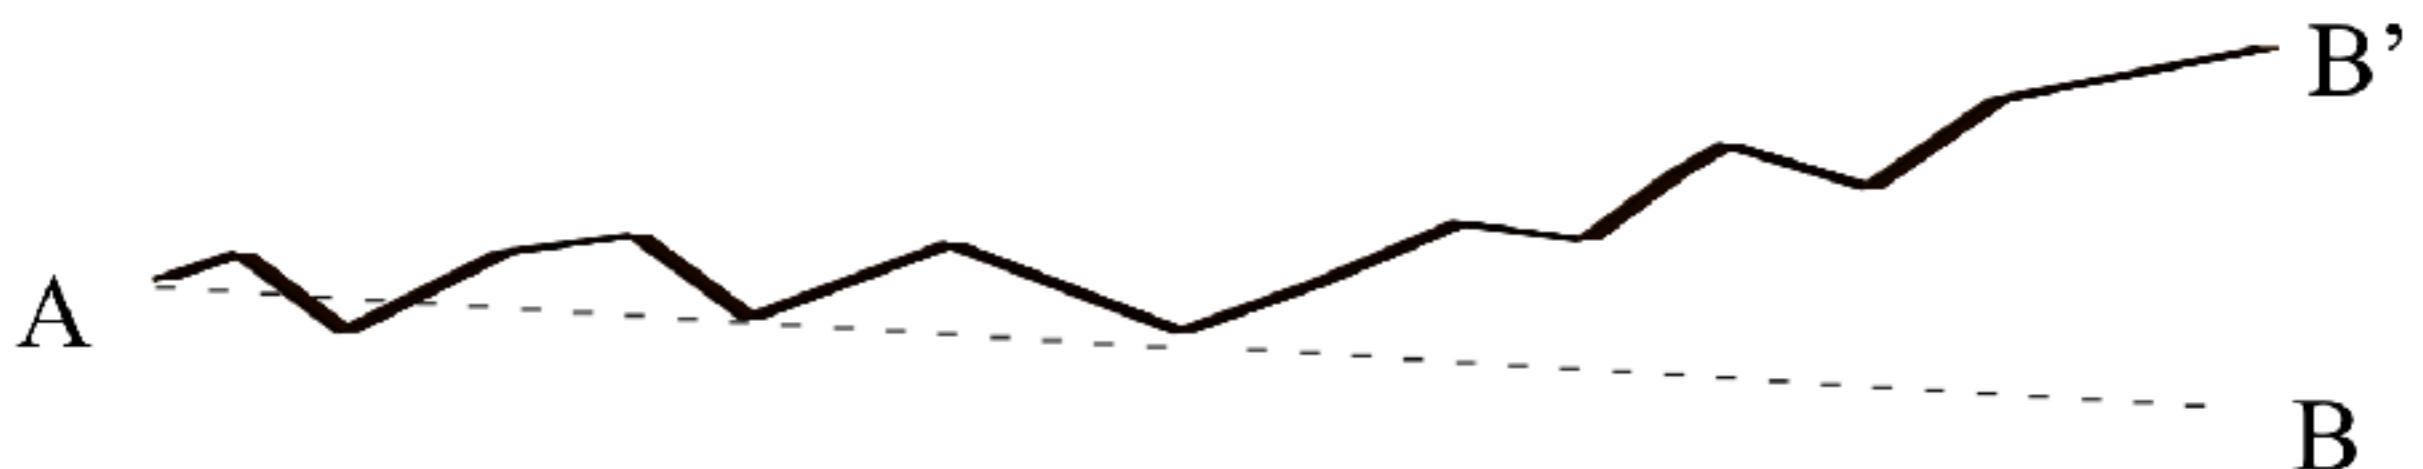

Debug Later Programming

<https://www.wingman-sw.com/>

Let's start with Small Step

Good Unit Test

Fast
Isolation
Repeatable
Self-validate
Timely

Let's start to write Unit tests with Java

JUnit

**BUT we need to separate the
Test code from Production
code !!**

We need new Project Structure

<https://maven.apache.org/>

POM file (1)

Project Object Model
Represent in XML format
Filename is **pom.xml**

POM file (2)

```
1<project xmlns="http://maven.apache.org/
2   <modelVersion>4.0.0</modelVersion>
3   <groupId>demo1</groupId>
4   <artifactId>demo1</artifactId>
5   <version>0.0.1-SNAPSHOT</version>
6 </project>
```

POM file (2)

Add new dependency => junit

```
1<project xmlns="http://maven.apache.org/POM/4.0.0"
2   xmlns:xsi="http://www.w3.org/2001/XMLSchema-instantiation"
3   xsi:schemaLocation="http://maven.apache.org/POM/4.0.0
4     pom-4.0.0.xsd">
5   <modelVersion>4.0.0</modelVersion>
6   <groupId>demo1</groupId>
7   <artifactId>demo1</artifactId>
8   <version>0.0.1-SNAPSHOT</version>
9
10  <dependencies>
11    <dependency>
12      <groupId>junit</groupId>
13      <artifactId>junit</artifactId>
14      <version>4.12</version>
15      <scope>test</scope>
16    </dependency>
17  </dependencies>
18</project>
```

<https://github.com/junit-team/junit4/wiki/use-with-maven>

Write first unit test case

The ratio of time spent in code
Read vs Write is +10:1

Run your test in command line

\$mvn clean test

\$mvn clean package

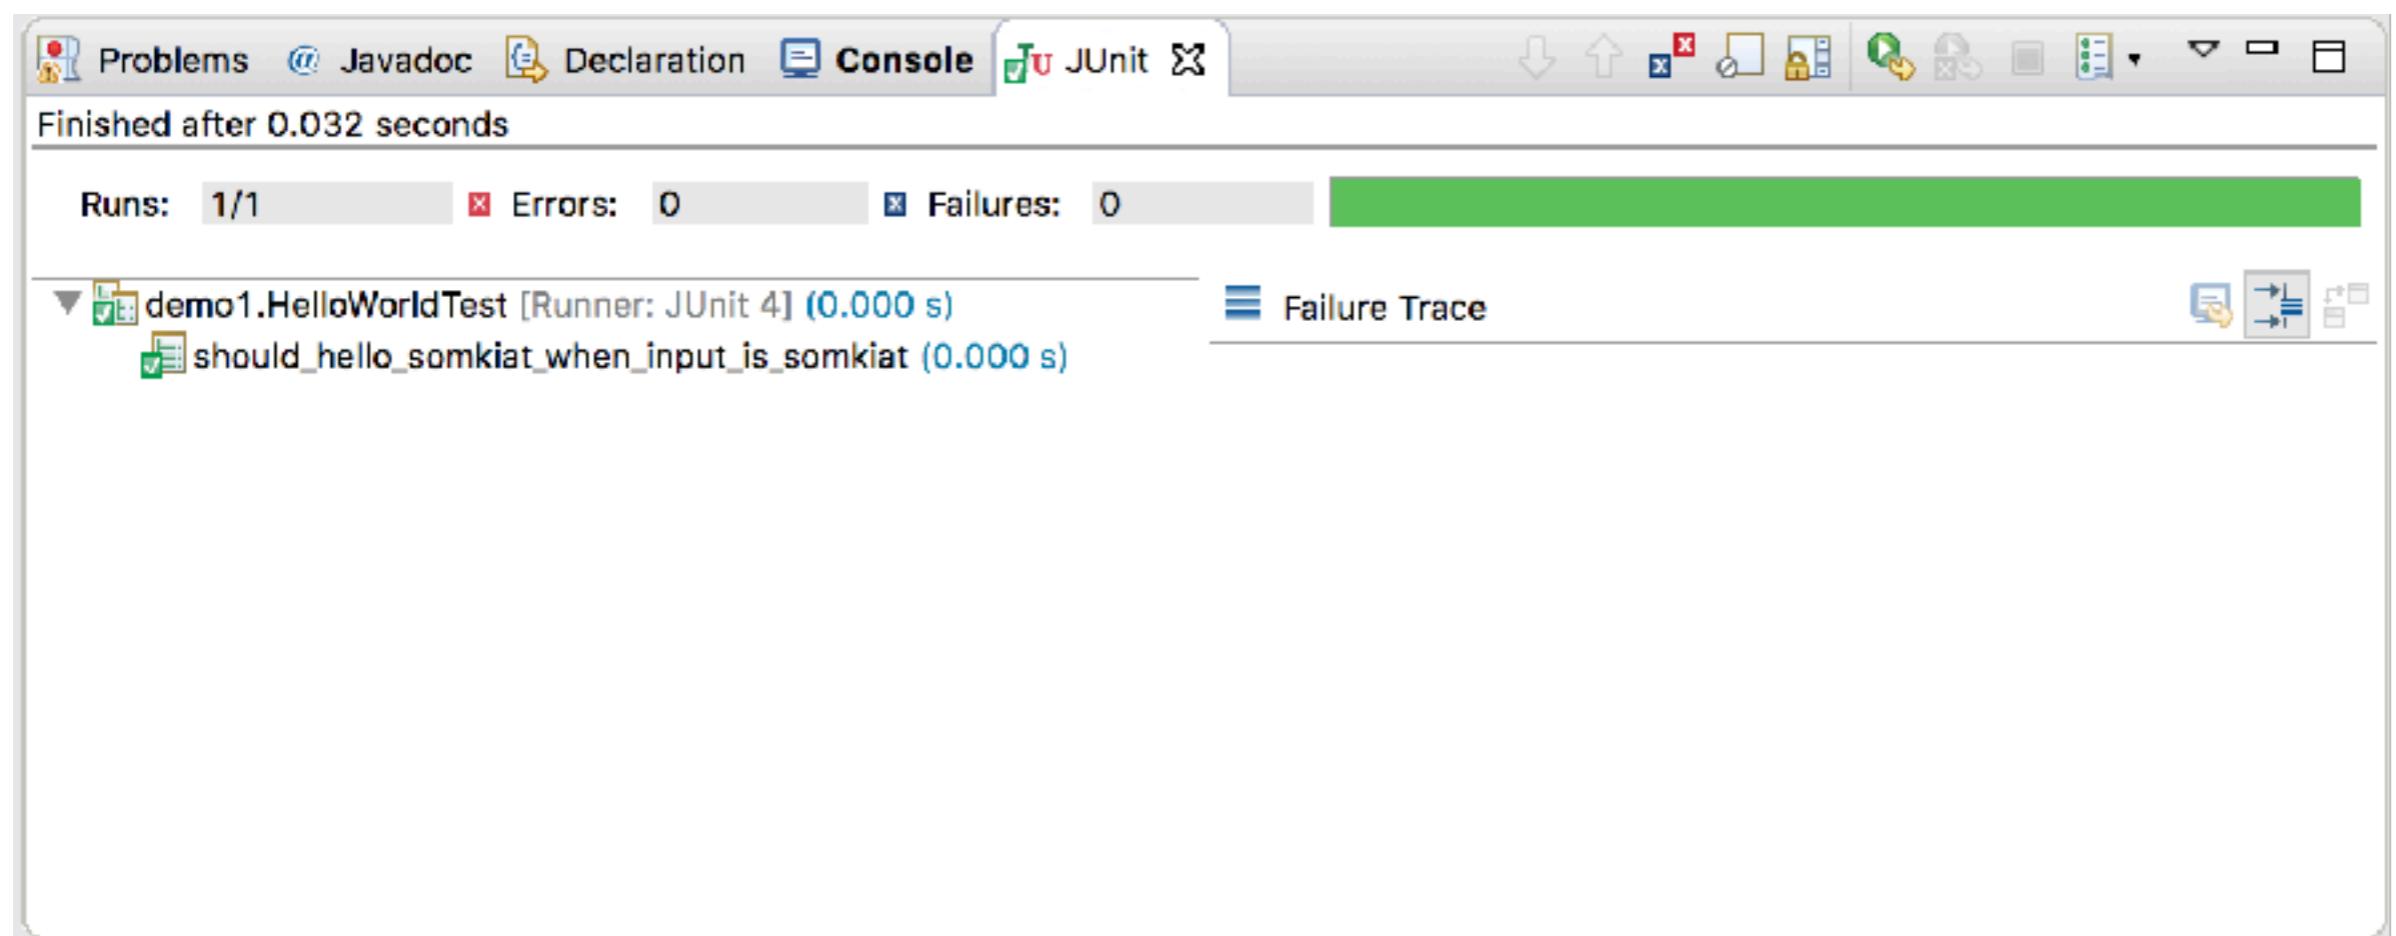

Make your test pass

```
public class Reception {  
    public String hello(String name) {  
        return "Hello " + name;  
    }  
}
```

Run test again

Result should be pass (Green)

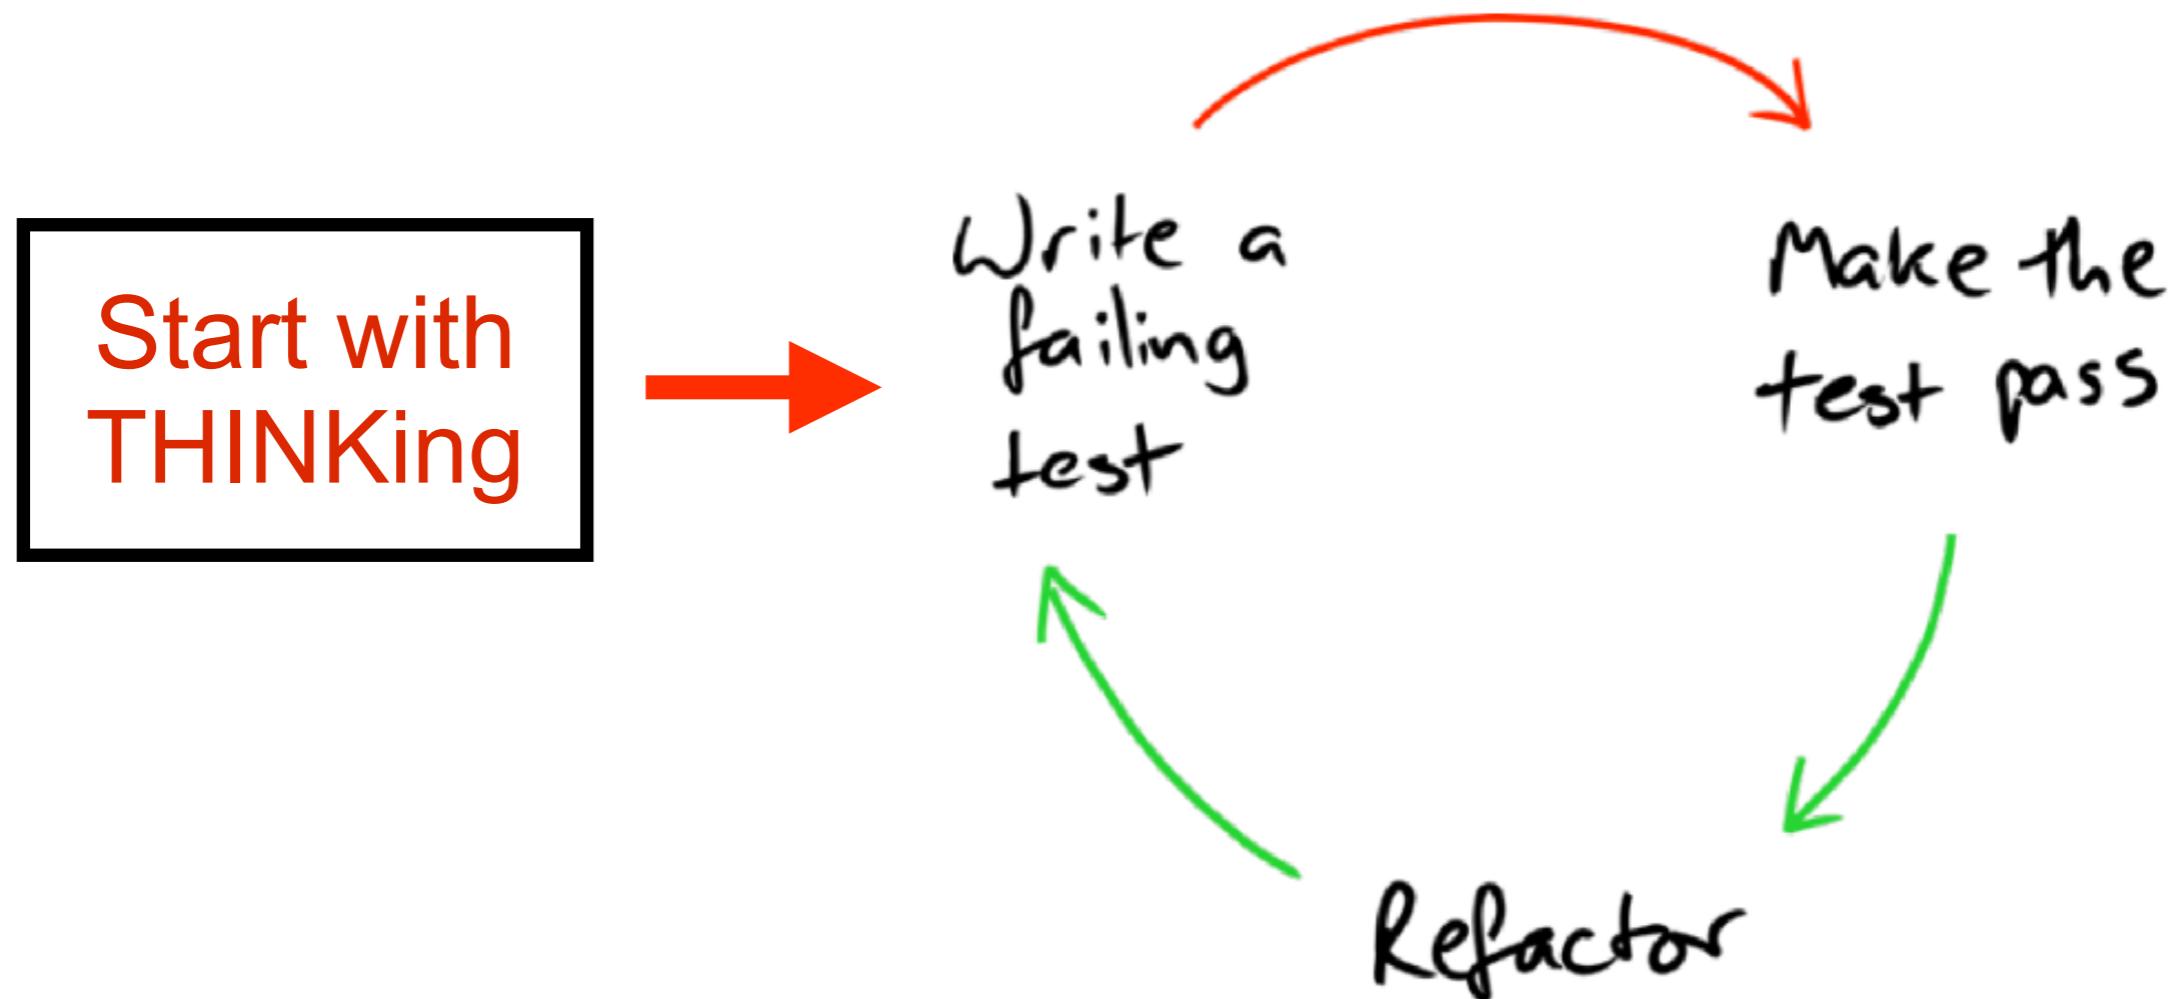

Write next test case ...

Simple Rule of TDD (again)

1. Write a failing test before write any code
2. Remove duplication code

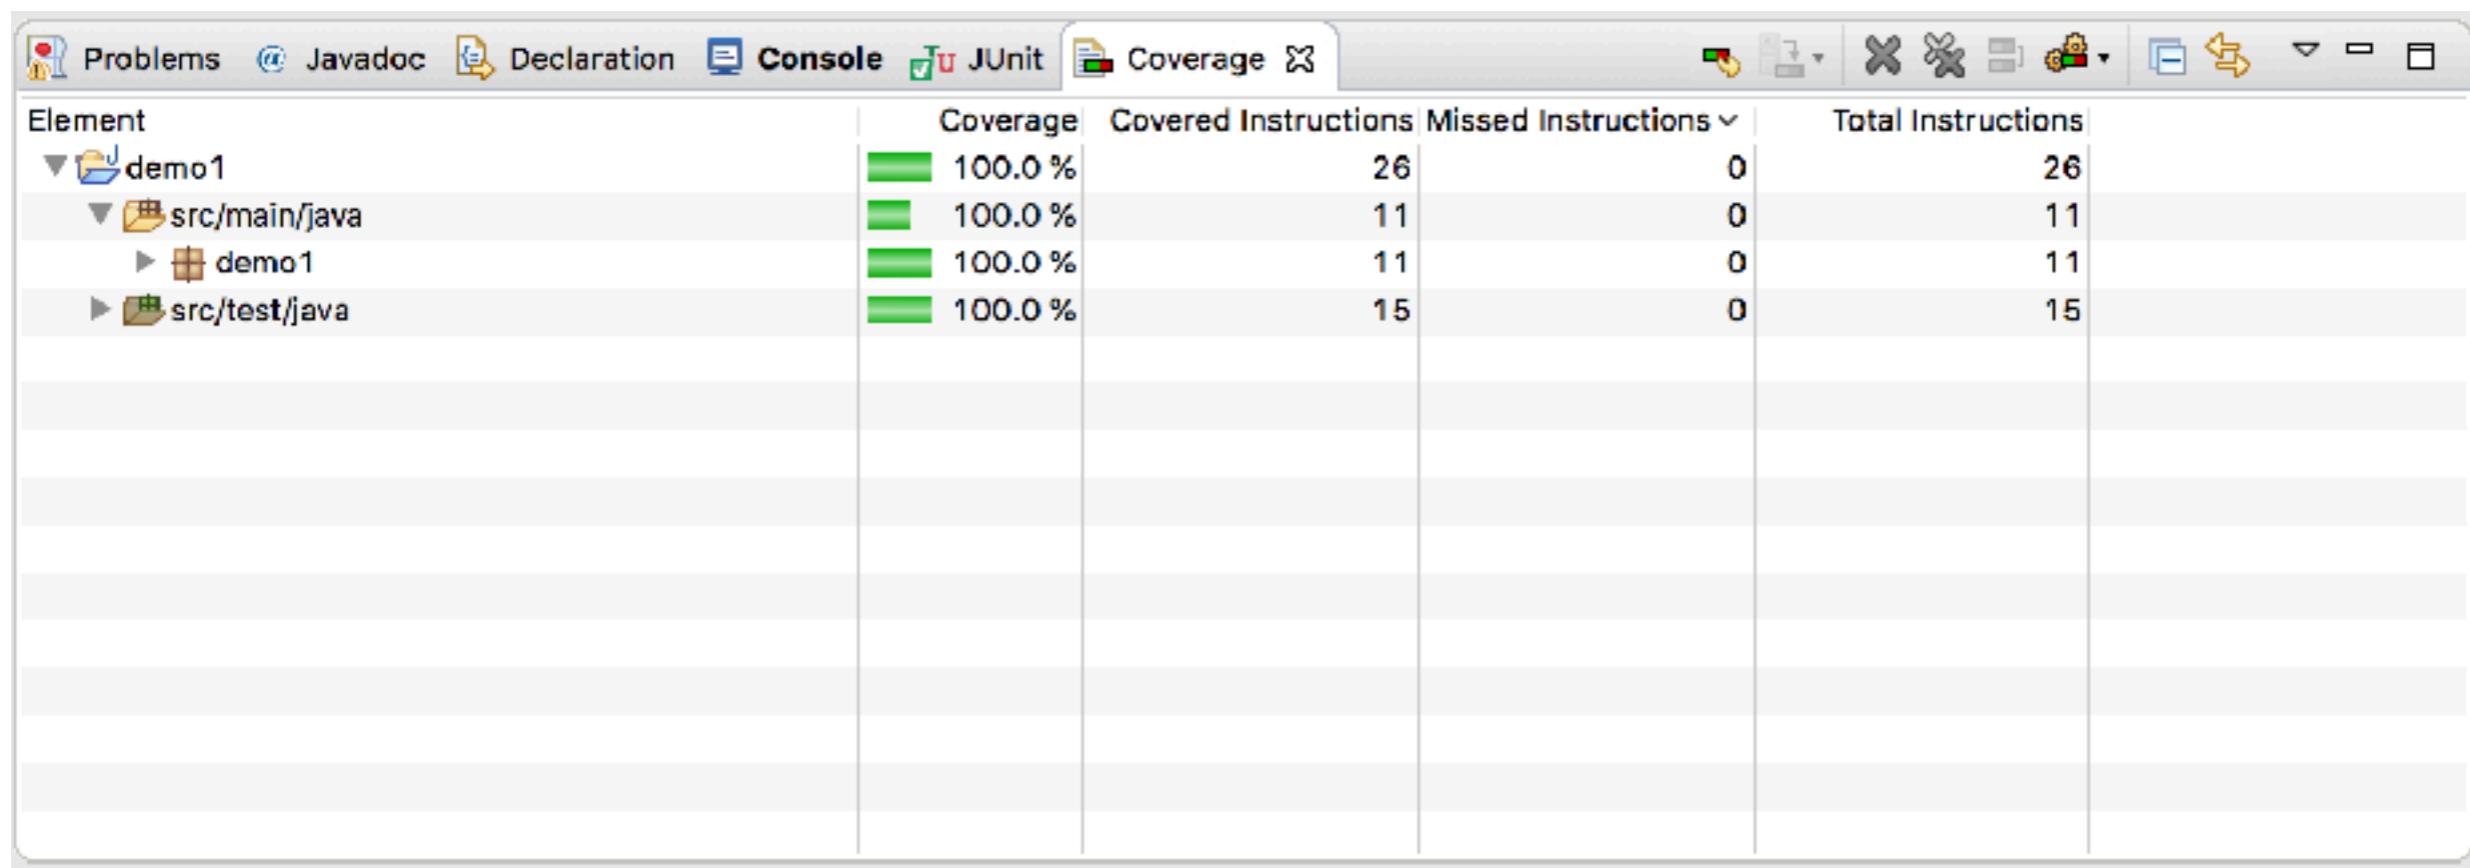

Code Coverage

Show result of code coverage

Summary result report

The screenshot shows a software interface with a toolbar at the top containing icons for Problems, Javadoc, Declaration, Console, JUnit, and Coverage. The Coverage tab is selected. Below the toolbar is a table titled 'Element' with columns for Coverage, Covered Instructions, Missed Instructions, and Total Instructions. The table lists four items under the 'demo1' project: 'src/main/java/demo1' with 100.0% coverage, 26 covered instructions, 0 missed instructions, and 26 total instructions; 'src/main/java/demo1' with 100.0% coverage, 11 covered instructions, 0 missed instructions, and 11 total instructions; 'src/main/java/demo1' with 100.0% coverage, 11 covered instructions, 0 missed instructions, and 11 total instructions; and 'src/test/java' with 100.0% coverage, 15 covered instructions, 0 missed instructions, and 15 total instructions.

| Element | Coverage | Covered Instructions | Missed Instructions | Total Instructions |
|---------------|----------|----------------------|---------------------|--------------------|
| demo1 | 100.0 % | 26 | 0 | 26 |
| src/main/java | 100.0 % | 11 | 0 | 11 |
| demo1 | 100.0 % | 11 | 0 | 11 |
| src/test/java | 100.0 % | 15 | 0 | 15 |

Show result of code coverage

See result in each file/class

```
1 package demo1;  
2  
3 public class Reception {  
4  
5     public String hello(String name) {  
6         return "Hello " + name;  
7     }  
8  
9 }
```

Workshop

Range of number

Create test case = **RangeTest**

| Input | Expected output |
|-------|-----------------|
| [1,5] | 1,2,3,4,5 |
| [1,5) | 1,2,3,4 |
| (1,5] | 2,3,4,5 |
| (1,5) | 2,3,4 |

Thinking before coding

Code Smell & Refactoring

https://en.wikipedia.org/wiki/Code_smell

Code Smell

Code Smell

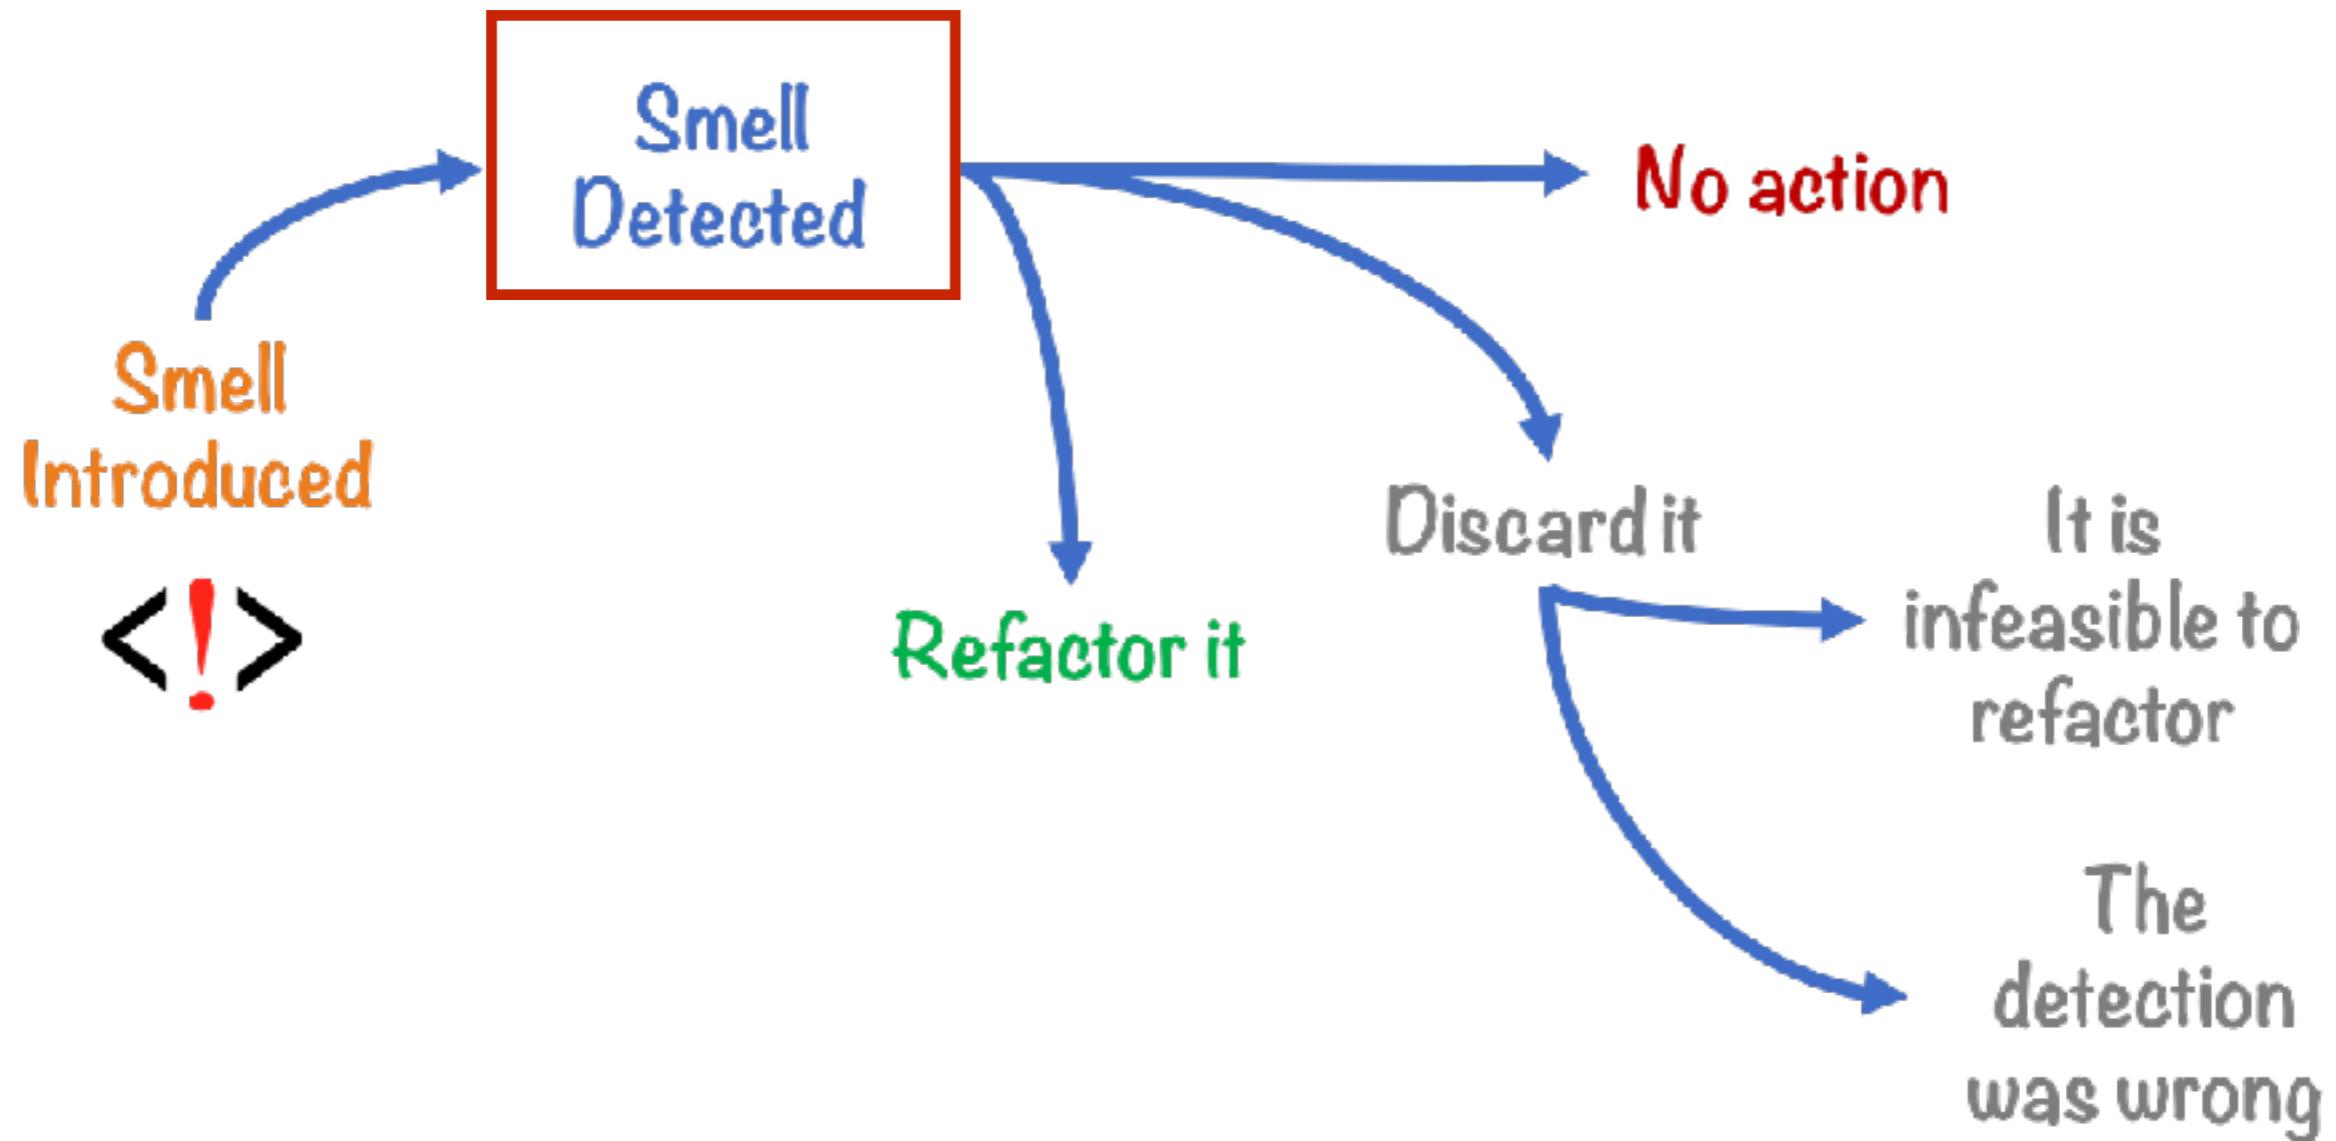

Code Smell make problems

```
41 @... static MappedField validateQuery(final Class clazz, final Mapper mapper, final StringBuilder origProp, final FilterOperator op, final
42     MappedField mf = null;
43     final String prop = origProp.toString();
44     boolean hasTranslations = false;
45     if (!origProp.substring(0, 1).equals("$")) {
46         final String[] parts = prop.split(regex: "W.");
47         if (clazz == null) { return null; }
48         MappedClass mc = mapper.getMappedClass(clazz);
49         //CHECKSTYLE:OFF
50         for (int i = 0; ; ) { --Eek!
51             //CHECKSTYLE:ON
52             final String part = parts[i];
53             boolean fieldIsArrayOperator = part.equals("$");
54             nf = mc.getMappedField(part);
55             //translate from java field name to stored field name
56             if (mf == null && !fieldIsArrayOperator) {
57                 mf = mc.getMappedFieldByJavaFieldName(part);
58                 if (validateNames && mf == null) {
59                     throw new ValidationException(format("The field '%s' could not be found in '%s' while validating - %s; if you wi:
60                 }
61                 hasTranslations = true;
62                 if (mf != null) {
63                     parts[i] = mf.getNameInStore();
64                 }
65             }
66             i++;
67             if (mf != null && mf.isMap()) {
68                 //skip the map key validation, and move to the next part
69                 i++;
70             }
71             if (i >= parts.length) {
72                 break;
73             }
74             if (!fieldIsArrayOperator) {
75                 //catch people trying to search/update into @Reference/@Serialized fields
76                 if (validateNames && !canQueryPast(nf)) {
77                     throw new ValidationException(format("Cannot use dot-notation past '%s' in '%s'; found while validating - %s", pa:
78                 }
79                 if (mf == null && mc.isInterface()) {
80                     break;
81                 } else if (mf == null) {
82                     throw new ValidationException(format("The field '%s' could not be found in '%s'", prop, mc.getClazz().getName()));
83                 }
84                 //get the next MappedClass for the next field validation
85                 mc = mapper.getMappedClass((mf.isSingleValue() ? mf.getType() : mf.getSubClass()));
86             }
87         }
88         //record new property string if there has been a translation to any part
89         if (hasTranslations) {
90             origProp.setLength(0); // clear existing content
91             origProp.append(parts[0]);
92             for (int i = 1; i < parts.length; i++) {
93                 --Parameter mutation!
```

What's a prop?
What's a part?
Why all the null checks?
Control the loop
Comments, because code is unclear
Parameter mutation!

Do you know Code smell ?

Code Smell (example)

Duplication code

Long method

Large class (God class)

Comments

Long parameter list

Switch/If statements

Divergent change (one class)

Shotgun surgery (one class)

<https://sourcemaking.com/refactoring/smells>

**Not taking too much
Show me the code**

Code Smell Workshop

<https://github.com/emilybache/Tennis-Refactoring-Kata>

SOLID principle

SOLID principle

SOLID

Software development is not a Jenga game.

1. Single Responsibility Principle

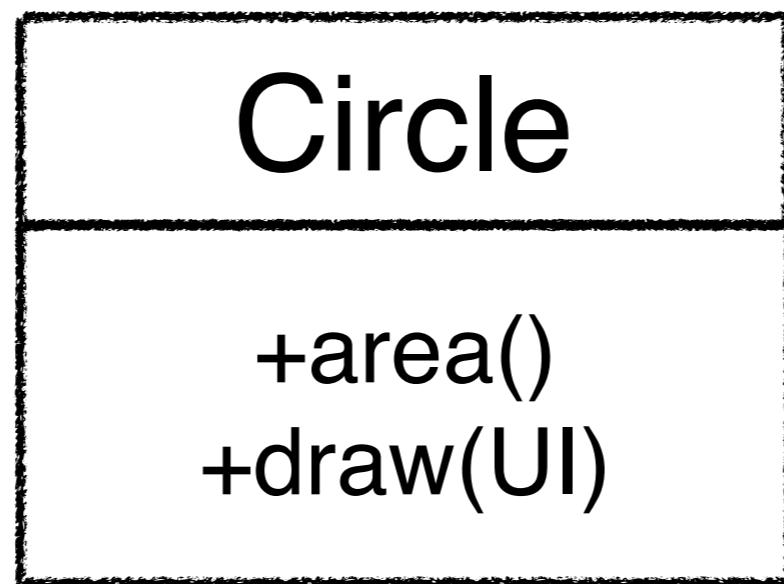

Single Responsibility Principle

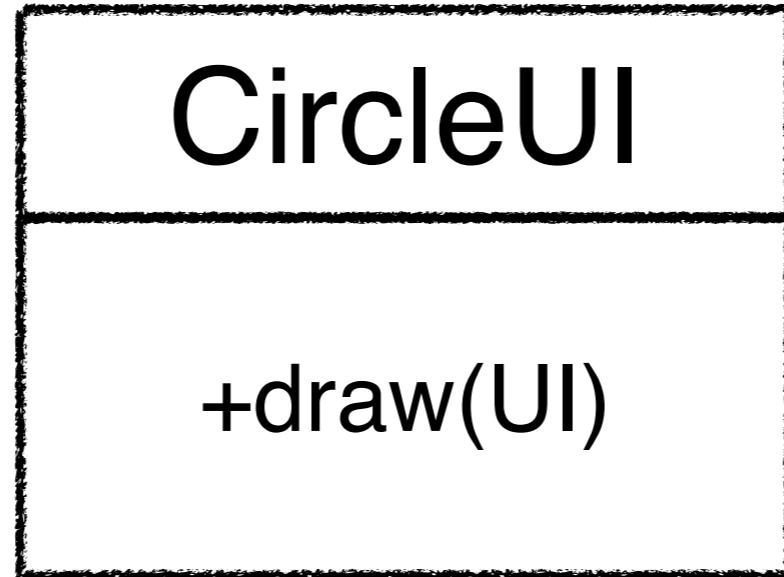

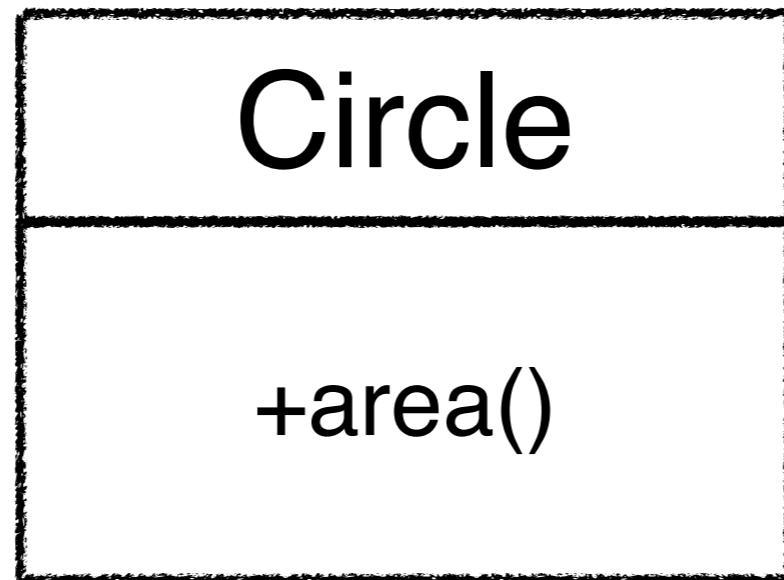

Just because you *can* doesn't mean you *should*.

Example

Example

2. Open-Closed Principle

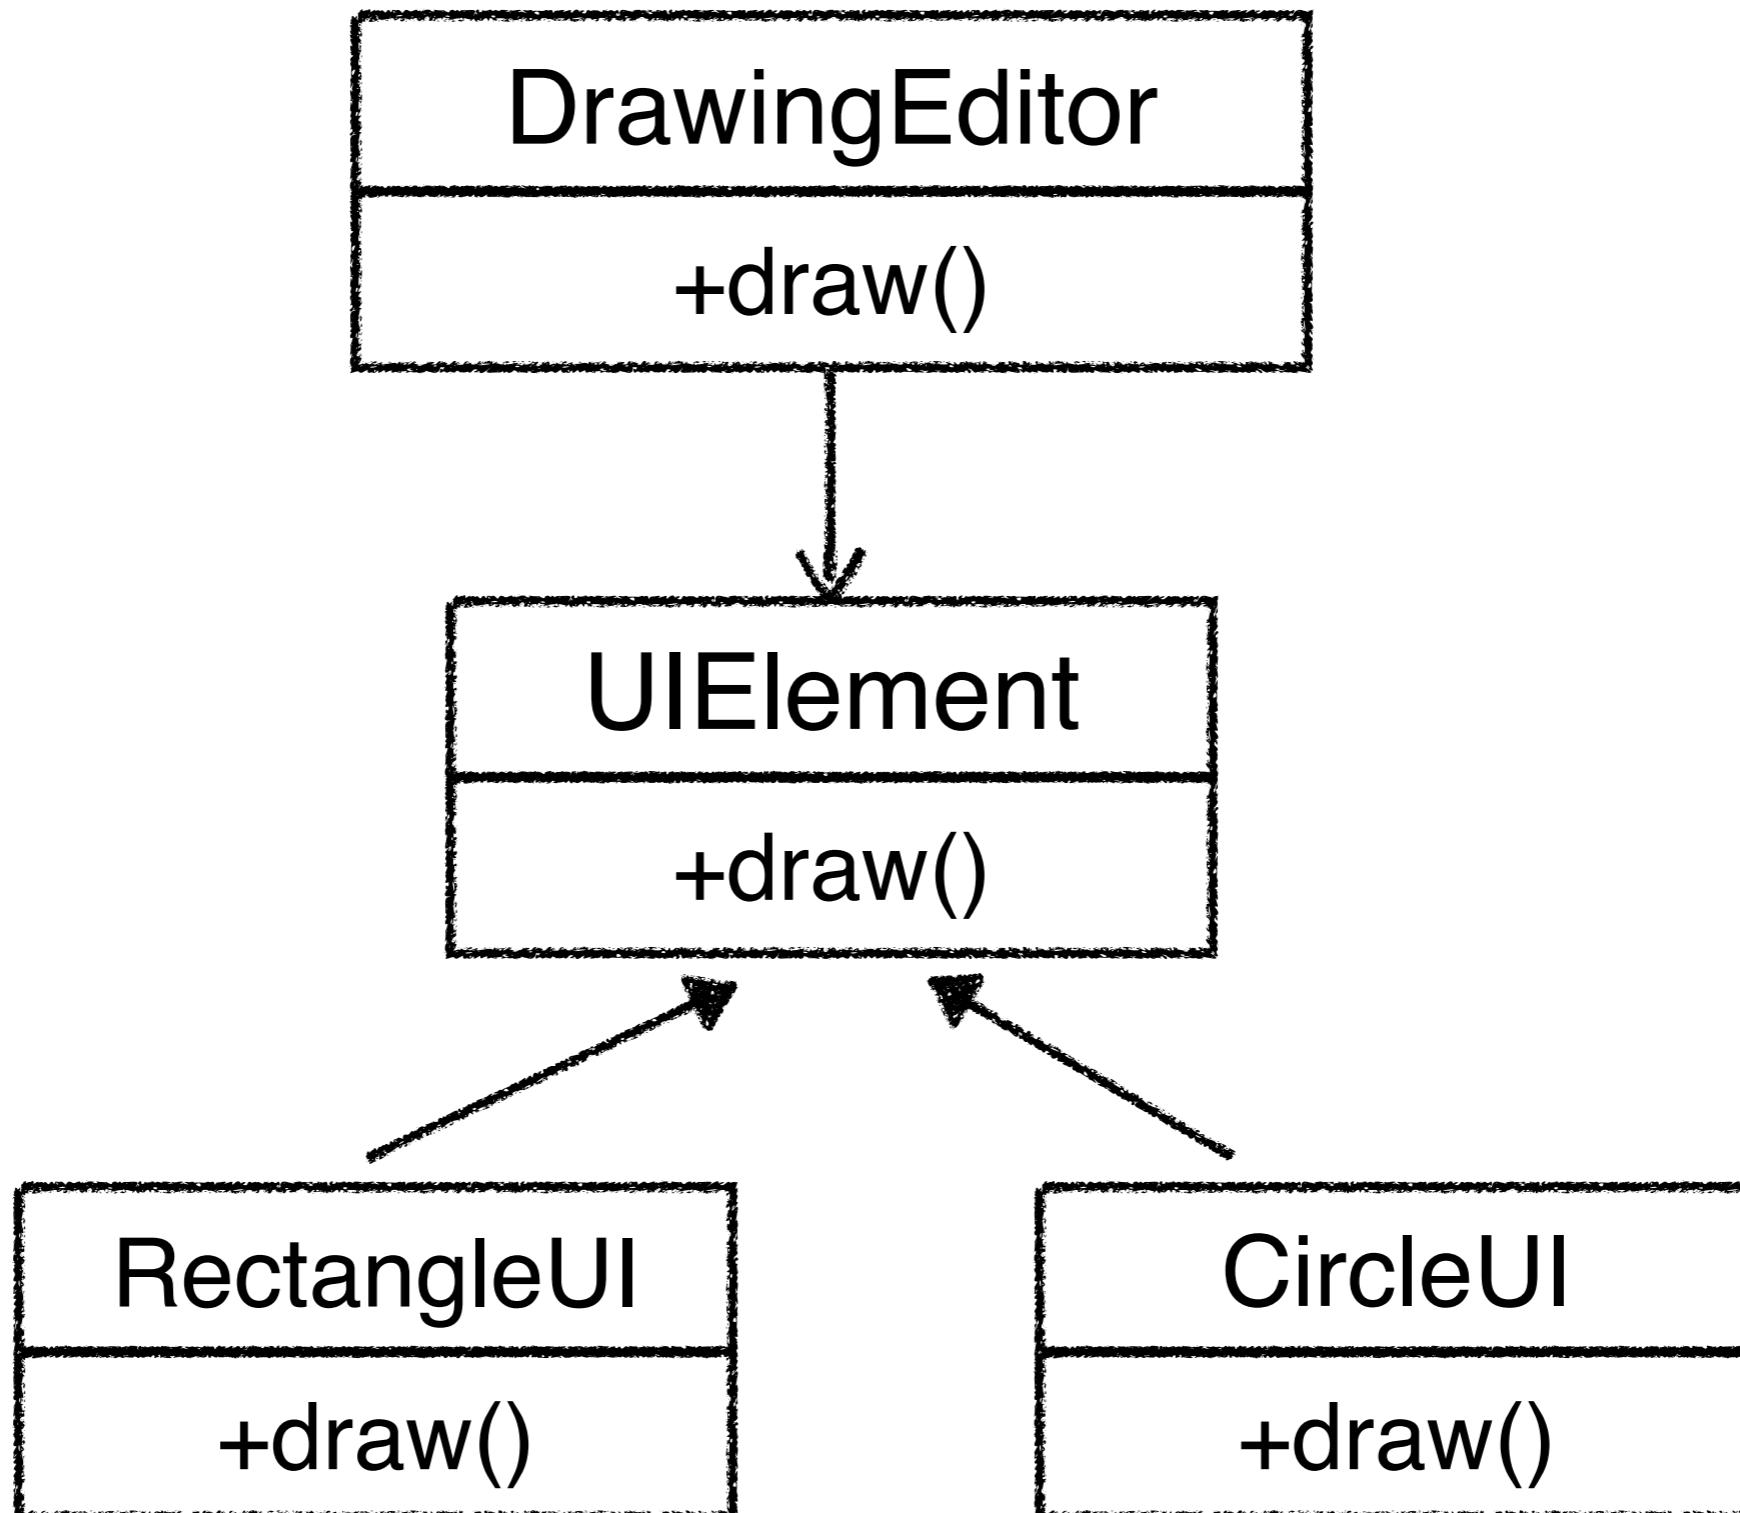

Example

DrawingEditor

```
+draw()  
-drawCircle()  
-drawRectangle()
```

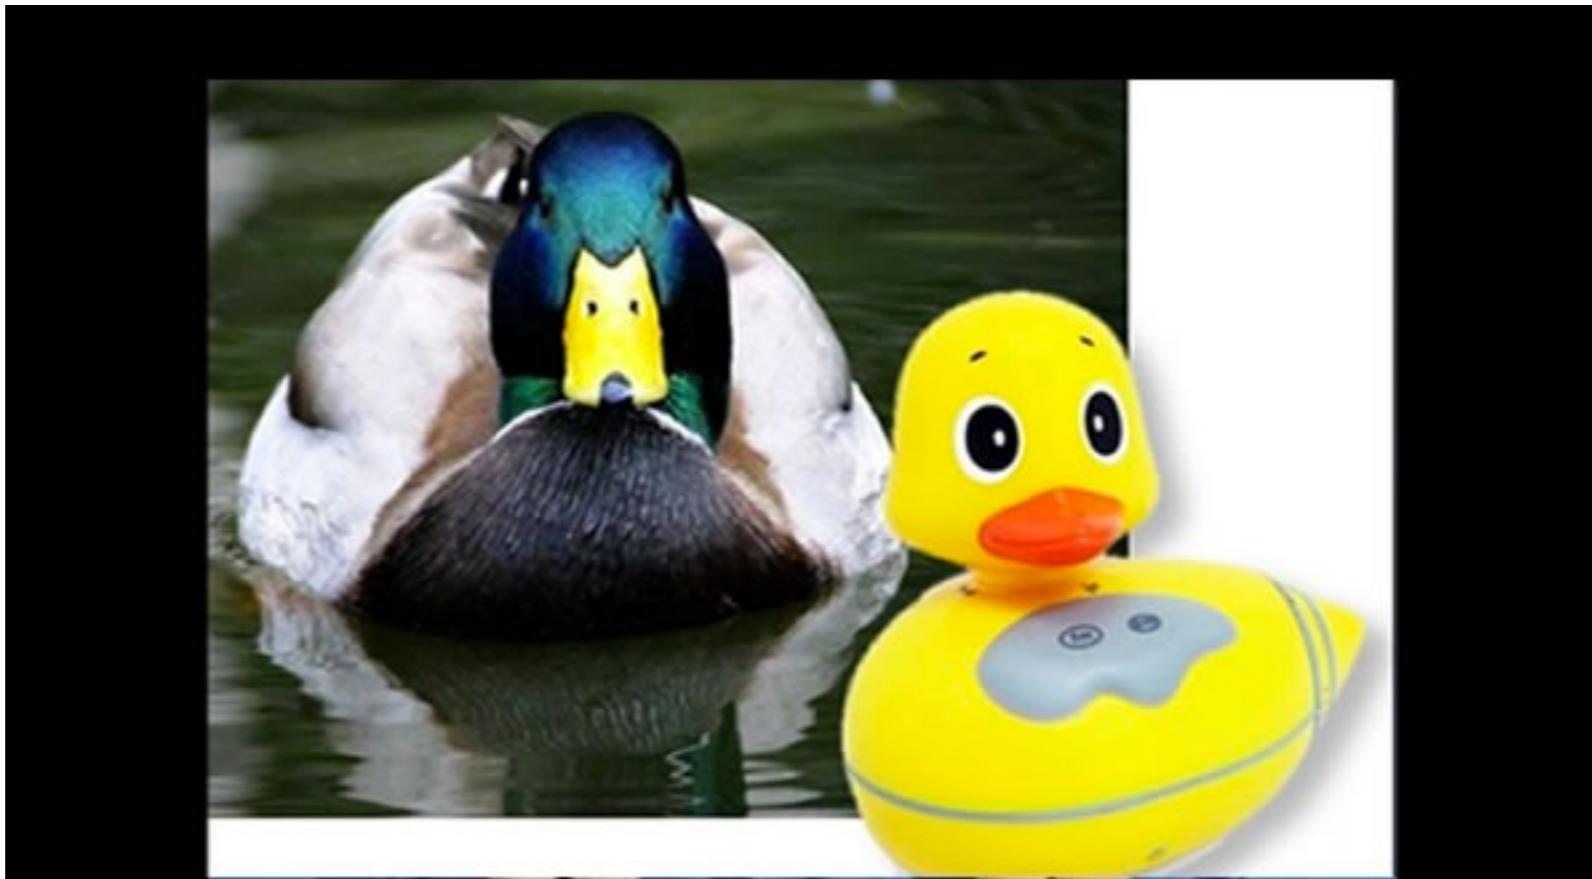

Example

Workshop

3. Liskov Substitution Principle

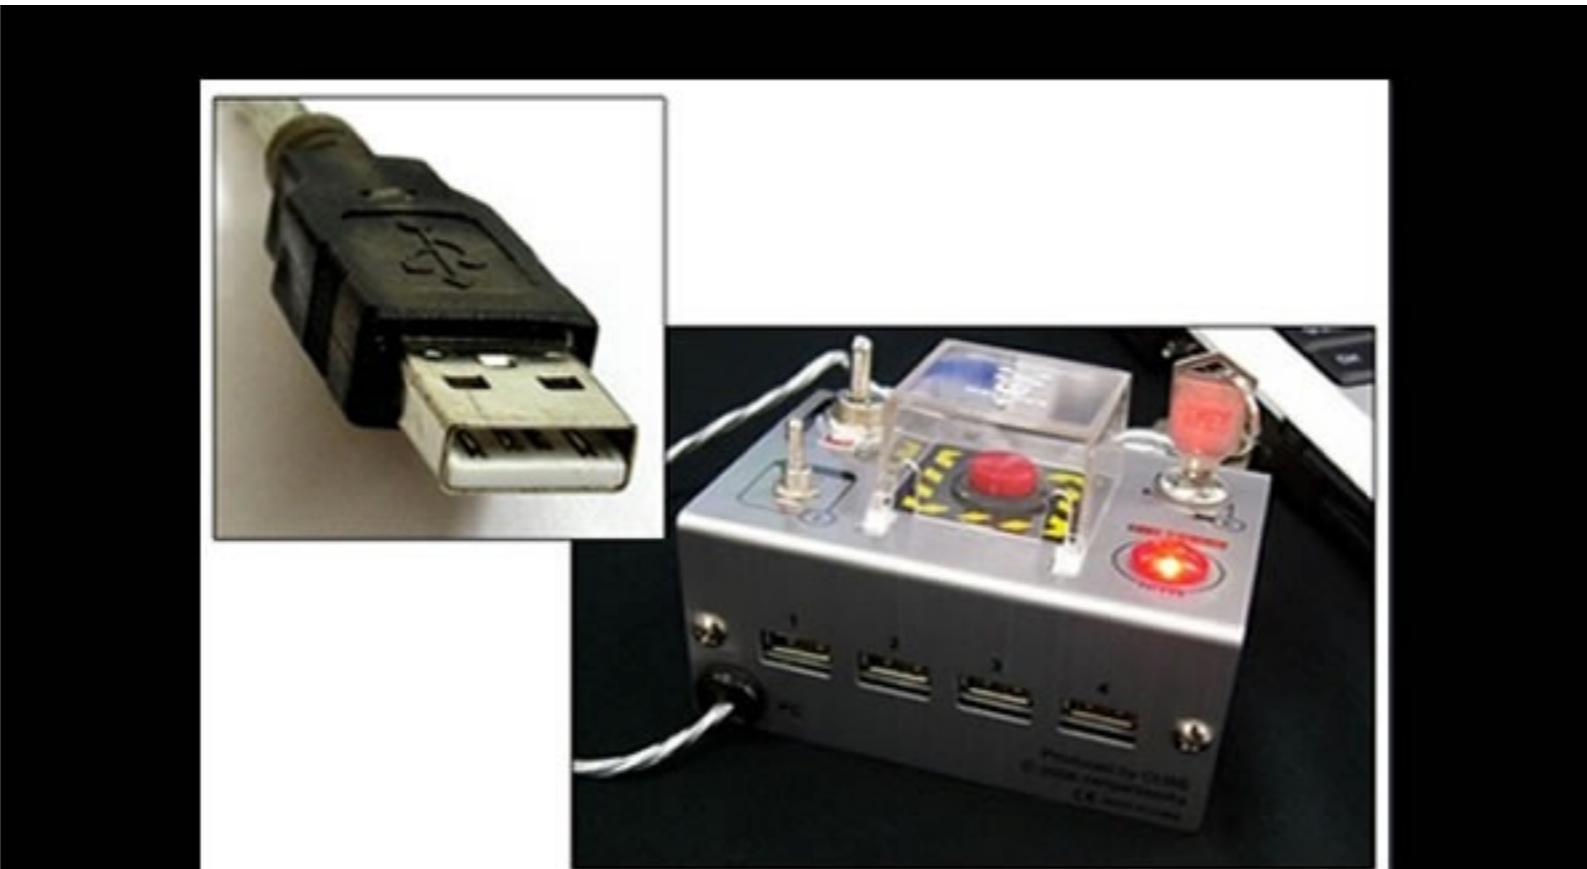

Liskov Substitution Principle

If it looks like a duck and quacks like a duck but needs batteries,
you probably have the wrong abstraction.

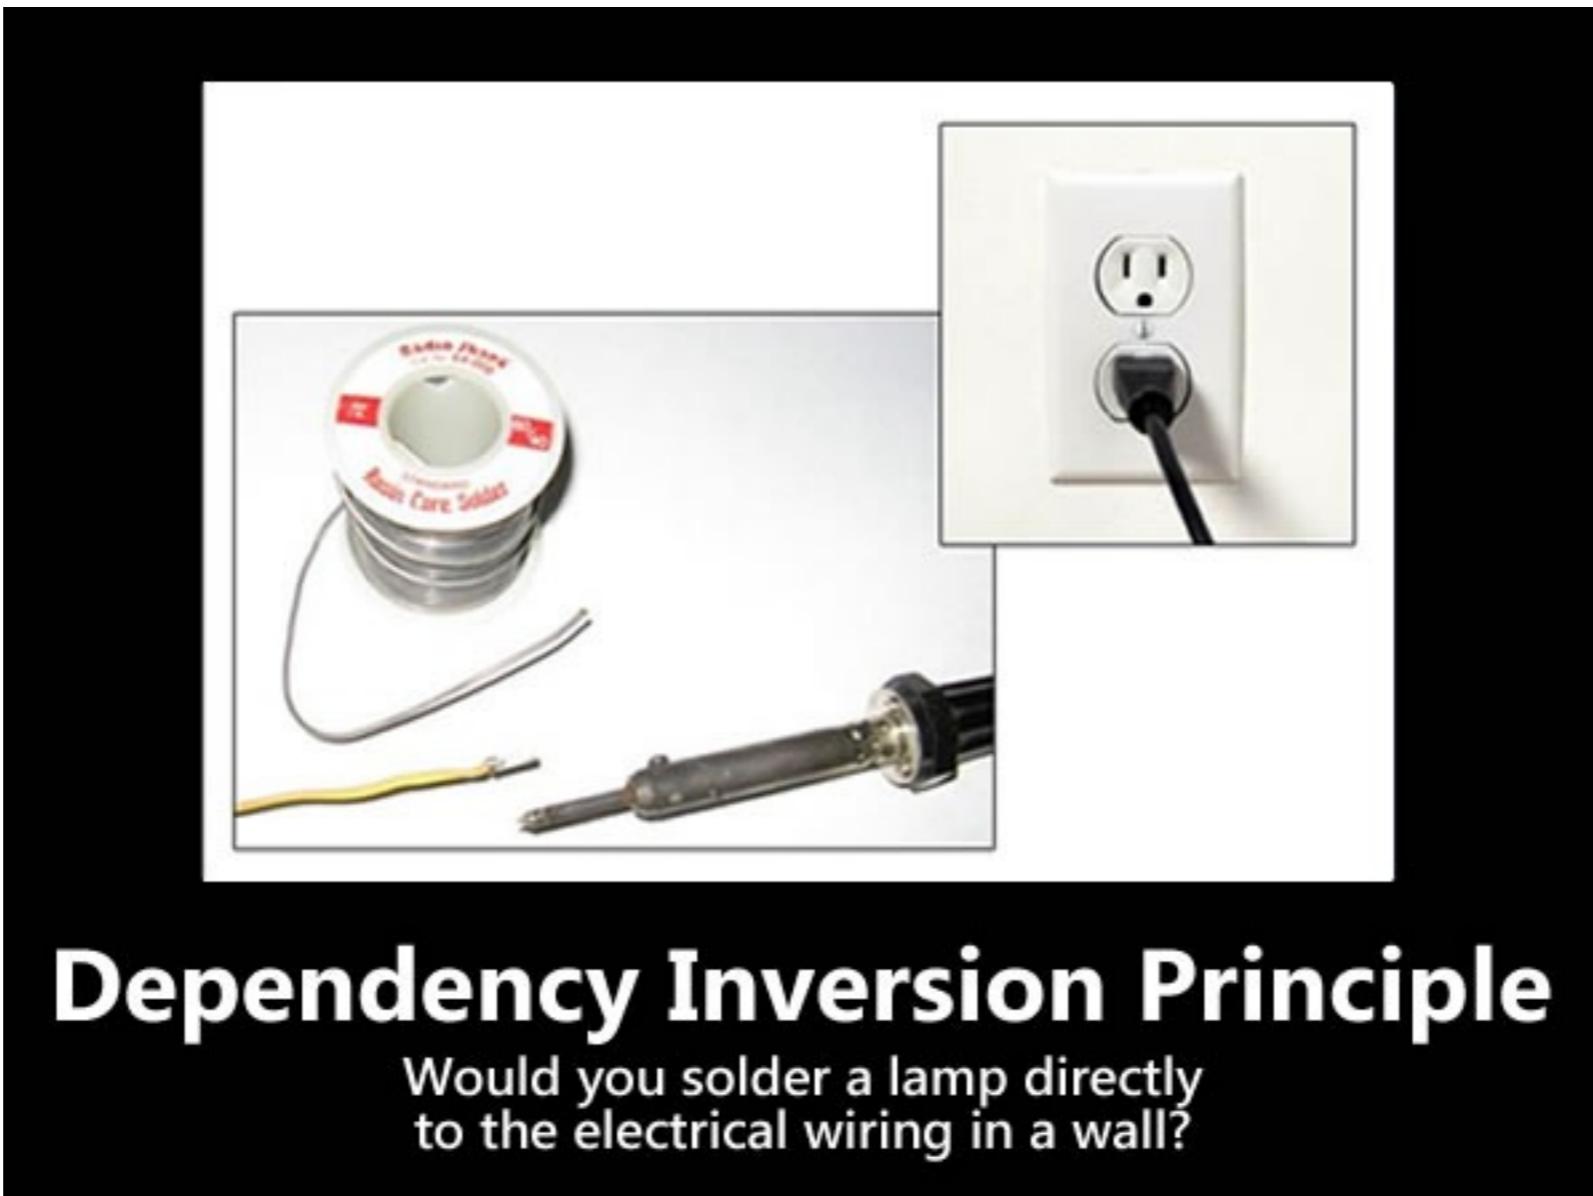

4. Interface Segregation Principle

Interface Segregation Principle
You want me to plug this in *where?*

5. Dependency Inversion Principle

Workshop

Spring Boot

Agenda

- RESTful API
- Java frameworks
- Building RESTful API with Spring Boot
- Spring Boot with Spring Data (JDBC/JPA)
- Testing with Spring Boot

REST

REpresentation **S**tate **T**ransfer

The style of software architecture behind
RESTful services

Defined in 2000 by Roy Fielding

https://www.ics.uci.edu/~fielding/pubs/dissertation/rest_arch_style.htm

Goals

Scalability
Generality of interfaces
Independent deployment of components

RESTful service

REST Request Messages

RESTful request is typically in form of
Uniform Resource Identifiers (URI)

REST Request Messages

RESTful request is typically in form of
Uniform Resource Identifiers (URI)

Structure of URI depend on specific service

REST Request Messages

RESTful request is typically in form of
Uniform Resource Identifiers (URI)

Structure of URI depend on specific service

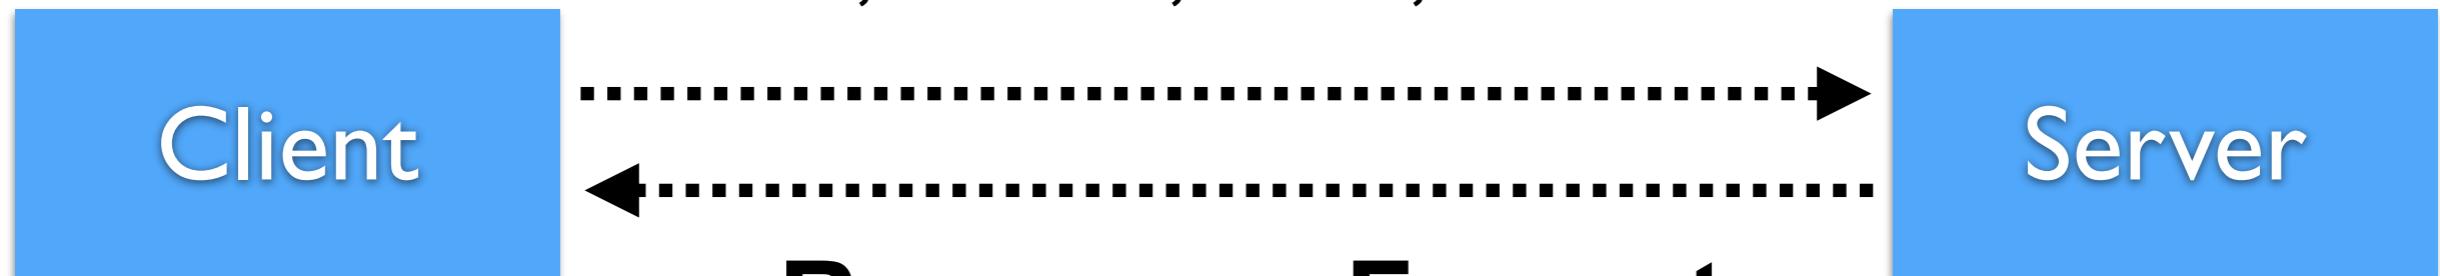

Request can include parameter and data in
body of request as XML, JSON etc.

REST Request & Response

Request Method

GET, POST, PUT, DELETE

Response Format

XML or JSON

HTTP Methods meaning

| Method | Meaning |
|-----------|-----------------------------------|
| GET | Read data |
| POST | Create/Insert new data |
| PUT/PATCH | Update data or insert if a new id |
| DELETE | Delete data |

Response format ?

Good APIs ?

Java Framework for RESTful

unirest

Lightweight HTTP Request Client Libraries

Dropwizard

Restlet

ACT.framework

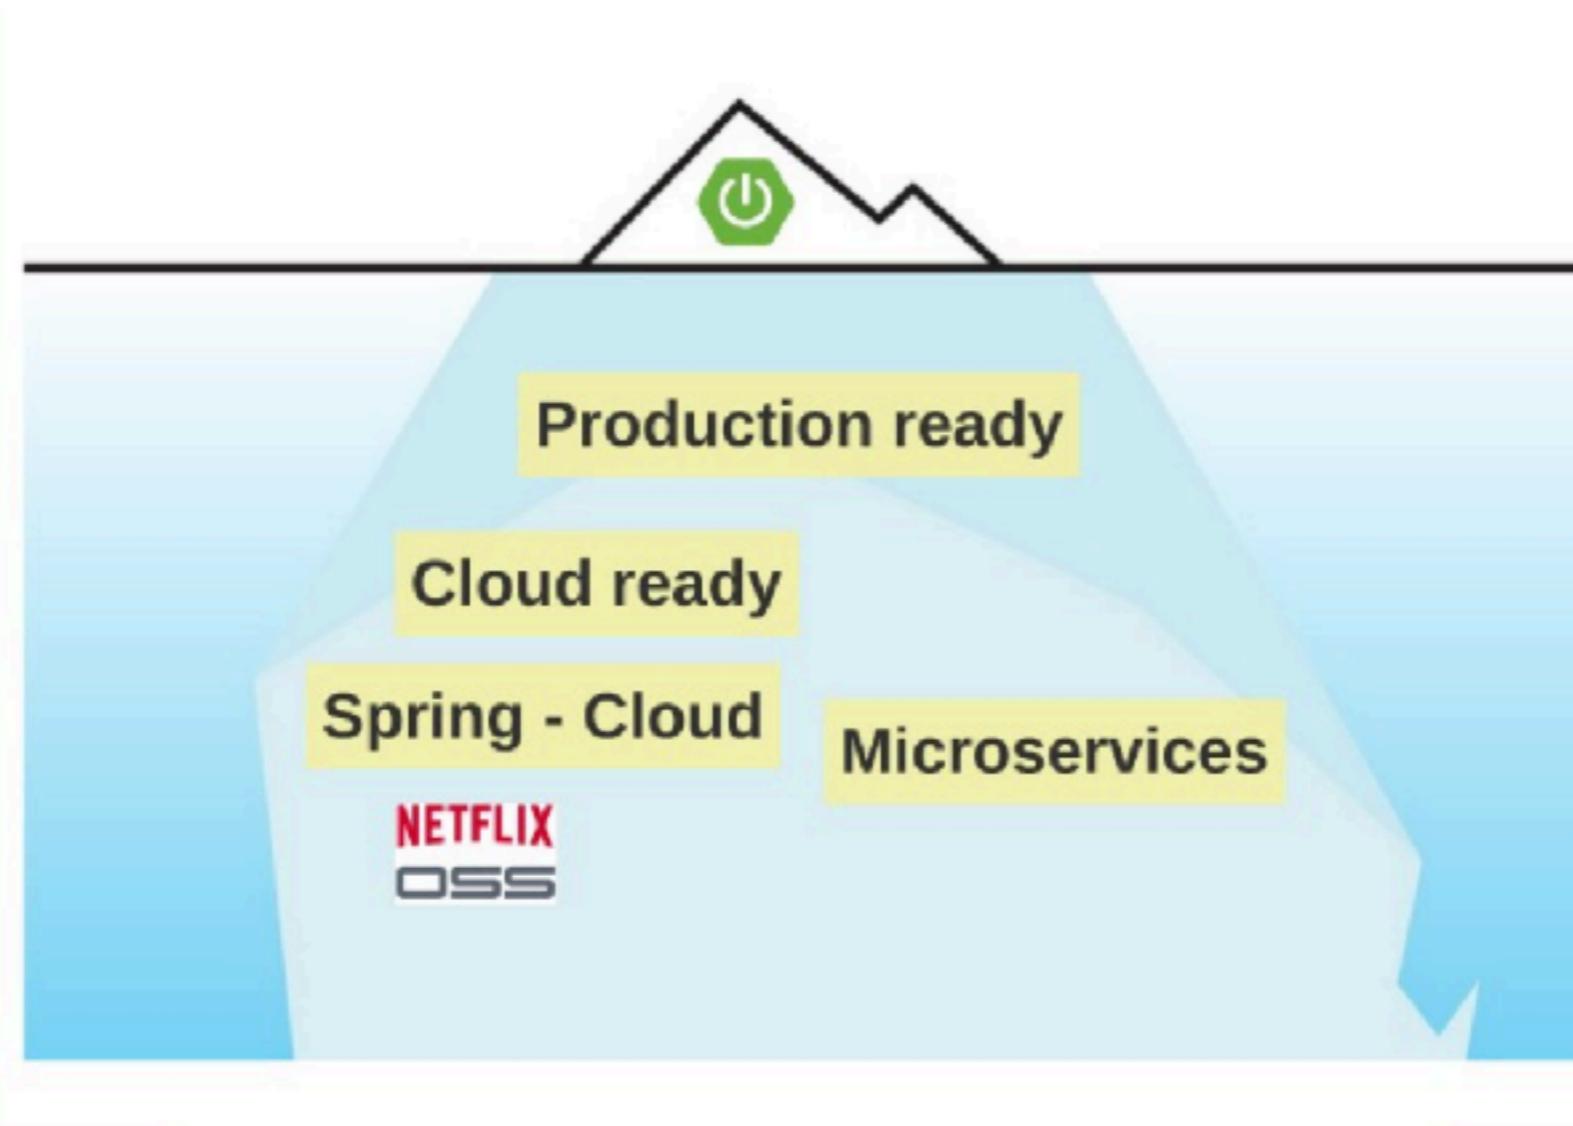

Hello Spring Boot 2.x

Why ?

Application skeleton generator
Reduce effort to add new technologies

What ?

Embedded application server

Integration with tools/technologies (starter)

Production tools (monitoring, health check)

Configuration management

Dev tools

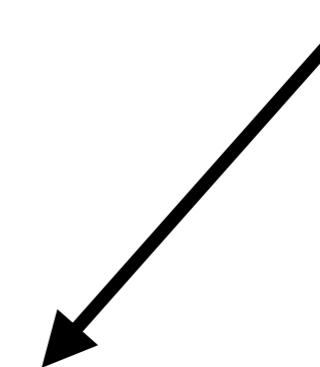

No source code generation, no XML

How ?

Apache Tomcat

JAR file

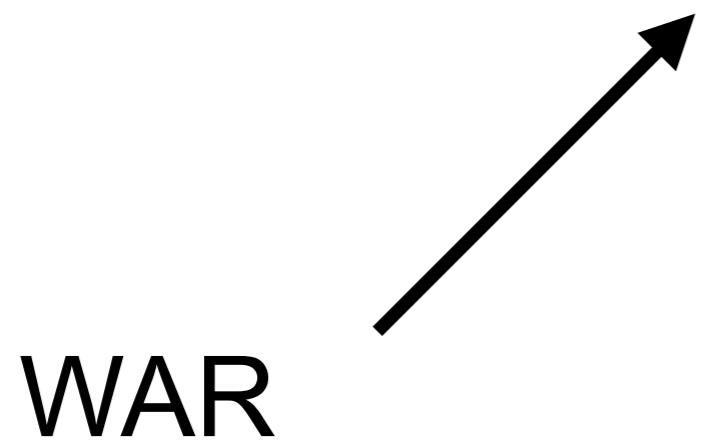

```
$mvn spring-boot:run  
$java -jar demo.jar
```

How ?

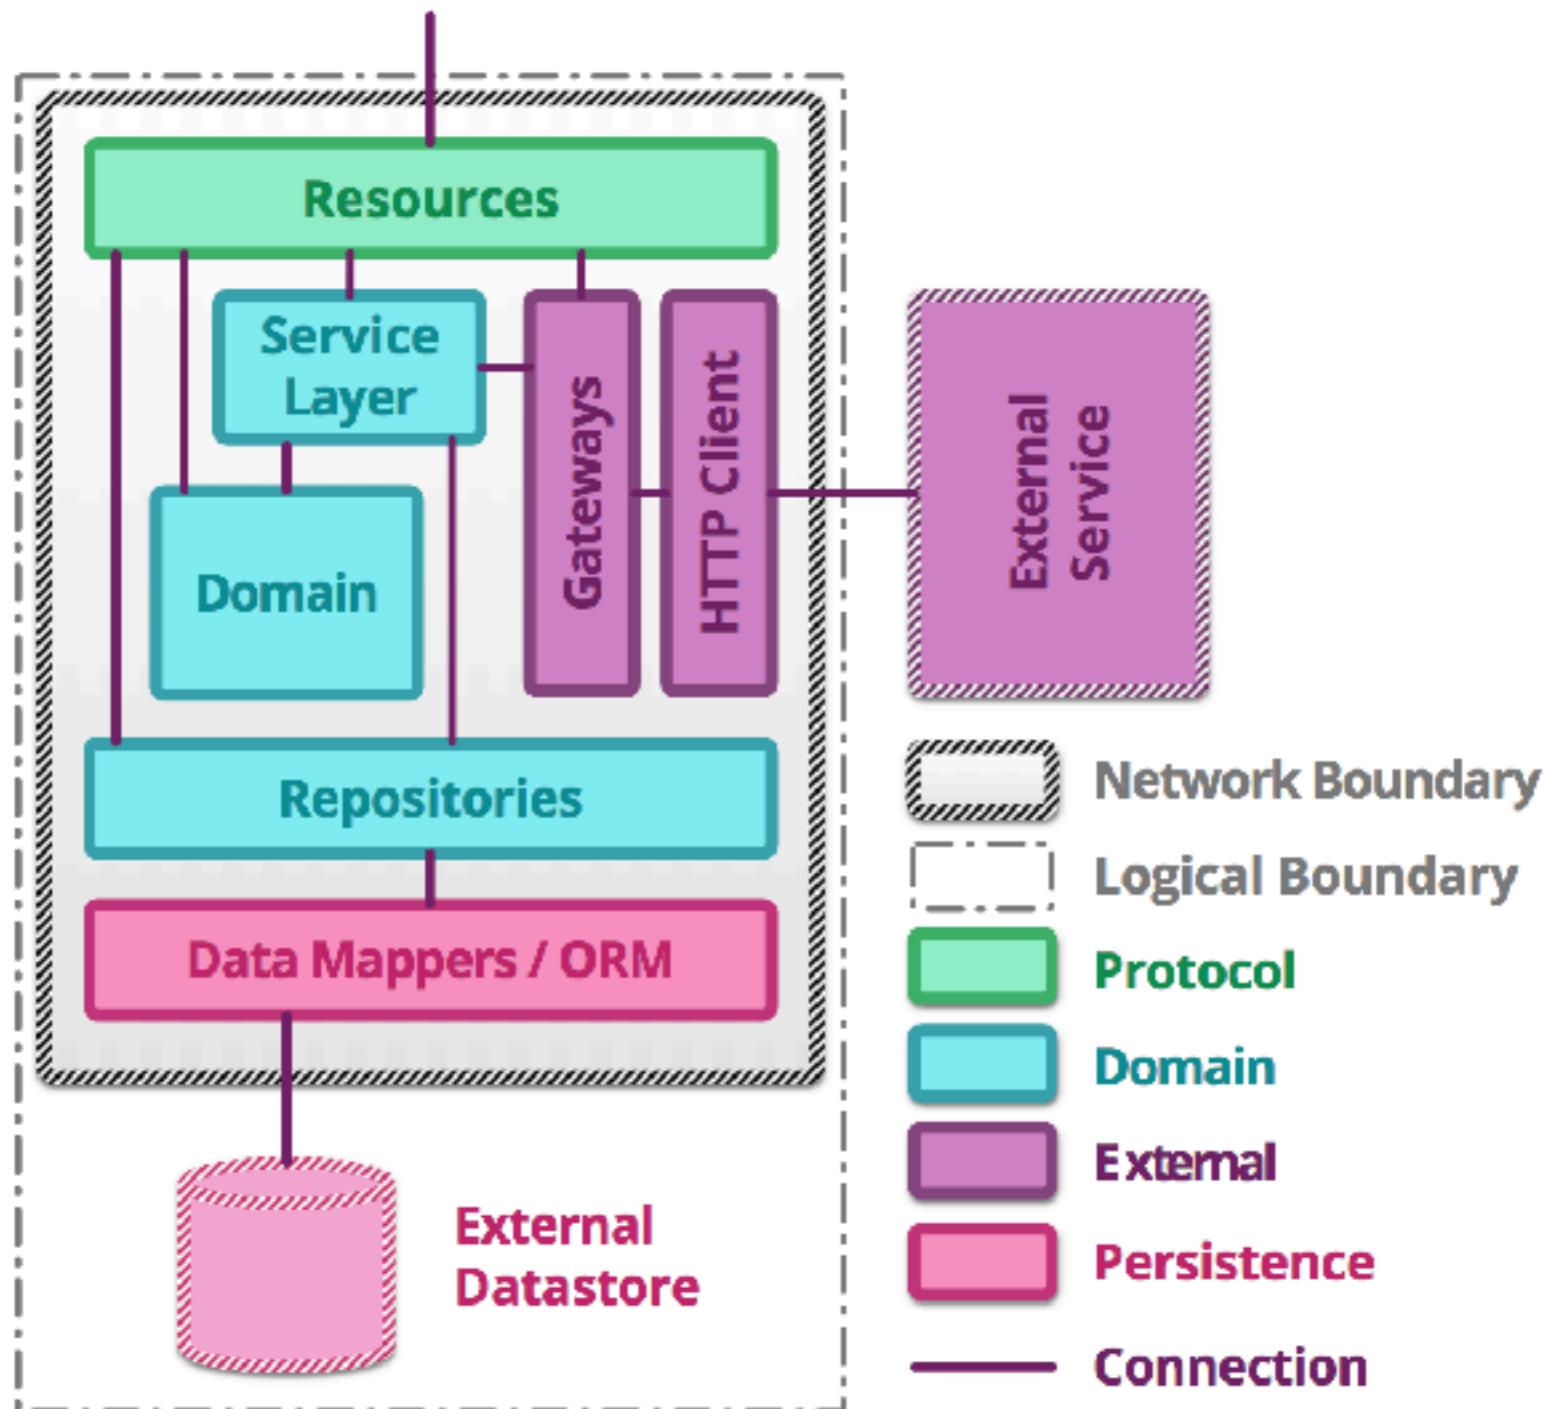

Apache Tomcat

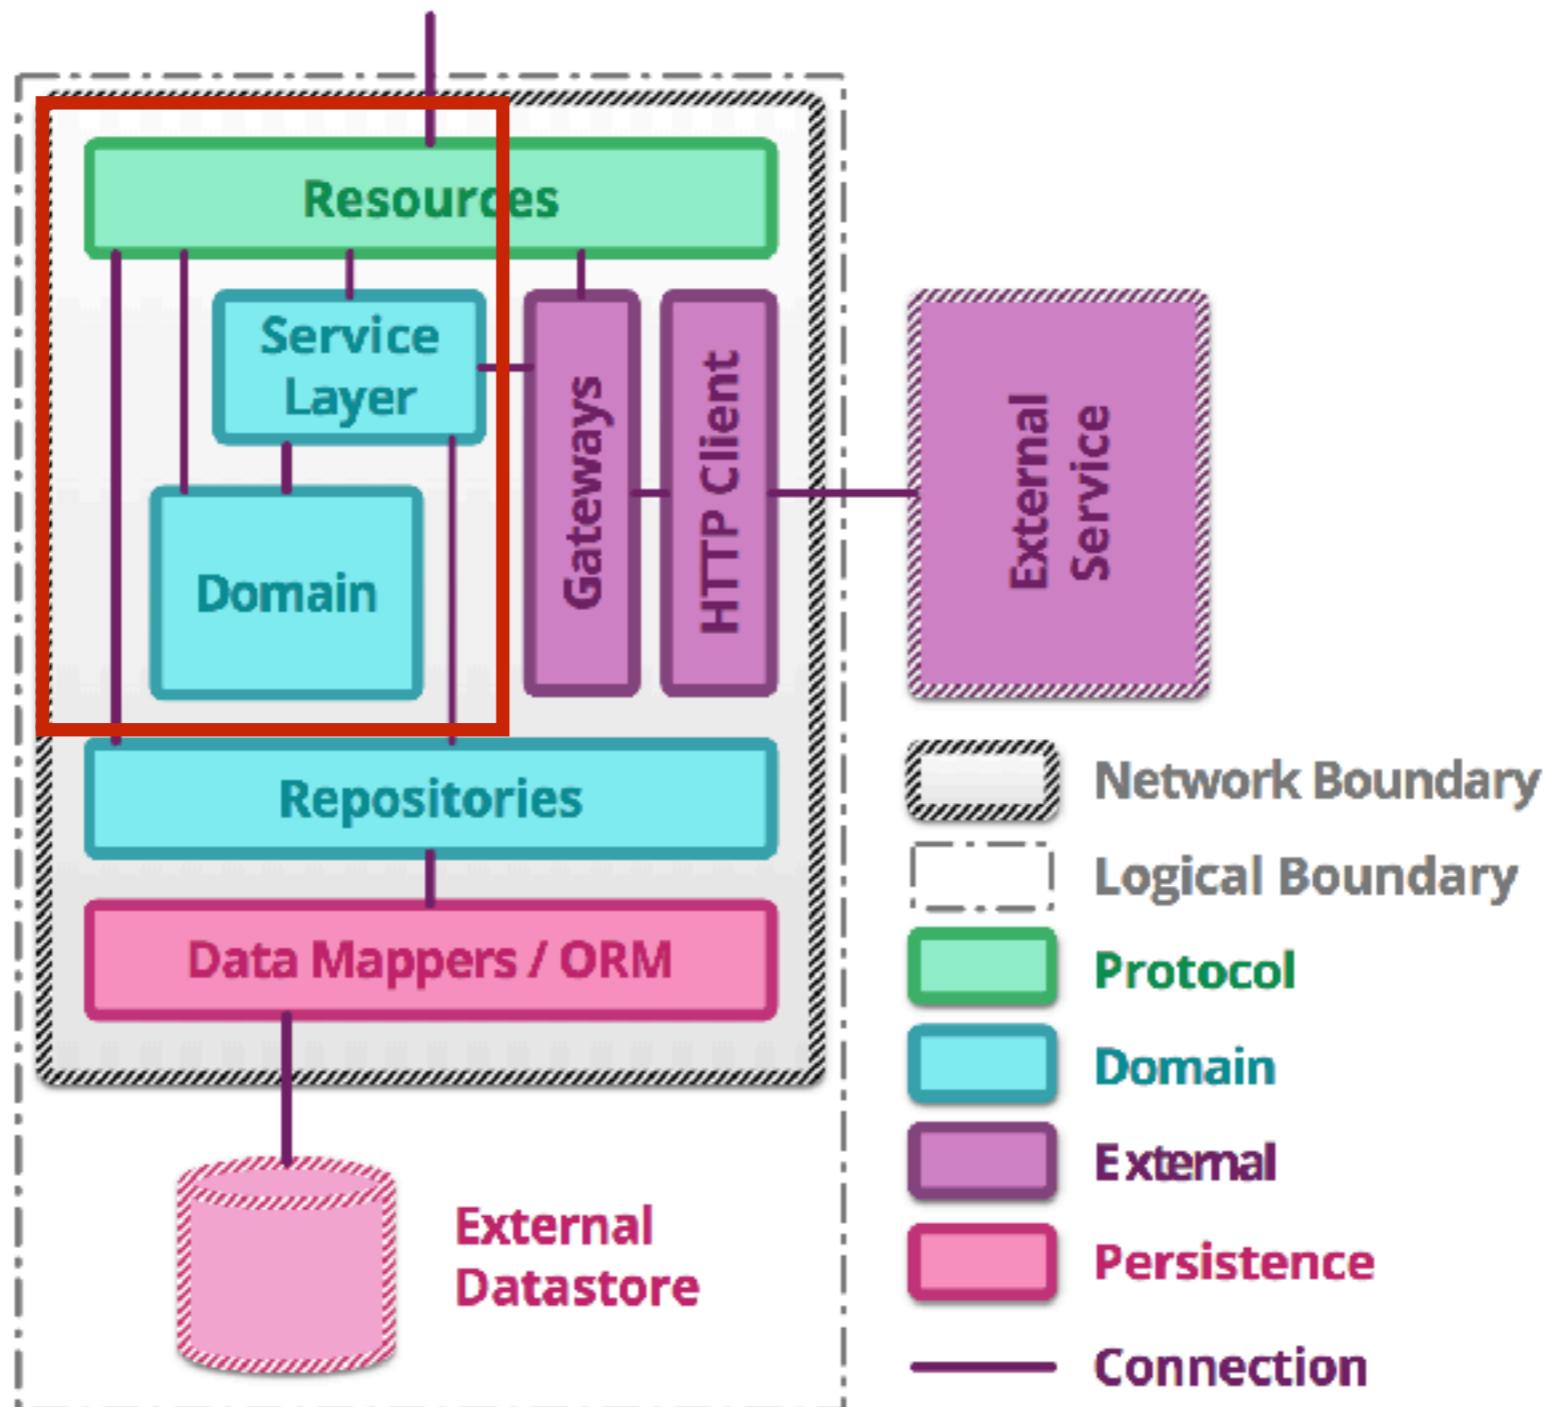

Building RESTful API with Spring Boot

Structure of Spring Boot

Spring Boot main class

```
package com.example.demo;

import org.springframework.boot.SpringApplication;
import org.springframework.boot.autoconfigure.SpringBootApplication;

@SpringBootApplication
public class DemoApplication {

    public static void main(String[] args) {
        SpringApplication.run(DemoApplication.class, args);
    }
}
```

Run project

```
./mvnw package  
$java -jar target/<file name>.jar
```

```
2018-06-07 13:03:30.412  INFO 12828 --- [  
oApplication           : Starting DemoApplication on  
D 12828 (started by somkiat in /Users/somkiat/Down  
2018-06-07 13:03:30.418  INFO 12828 --- [  
oApplication           : No active profile set, fall
```

Custom banner

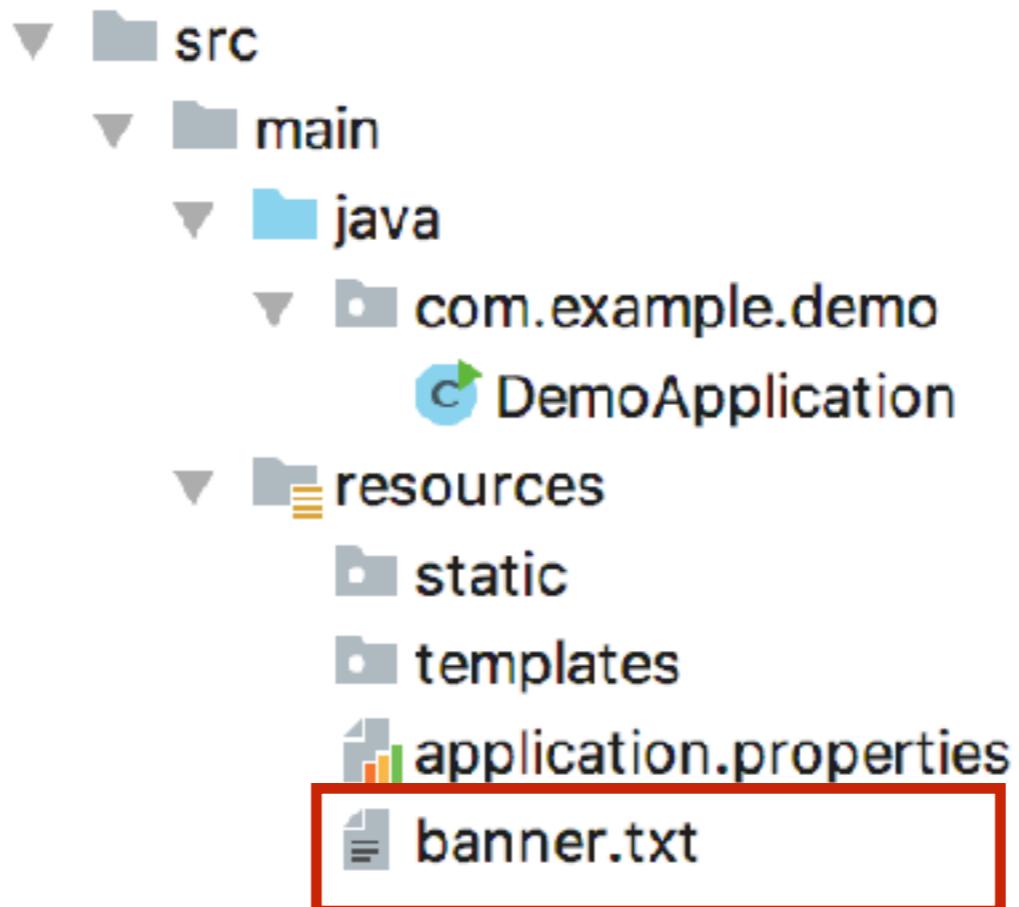

The Spring Boot logo is a complex arrangement of various characters including slashes, parentheses, brackets, and underscores, all connected by a network of lines to form a circular, organic shape.

```
2018-06-07 13:03:30.412  INFO 12828 --- [  
  oApplication : Starting DemoApplication on  
D 12828 (started by somkiat in /Users/somkiat/Down  
2018-06-07 13:03:30.418  INFO 12828 --- [  
  oApplication : No active profile set, fall
```

Custom banner (1)

Create file banner.txt or banner.png in resources folder

Custom banner (2)

```
@SpringBootApplication
public class DemoApplication {

    public static void main(String[] args) {
        ImageBanner banner = new ImageBanner(
            new ClassPathResource("try.png"));

        new SpringApplicationBuilder()
            .sources(DemoApplication.class)
            .banner(banner)
            .run();
    }
}
```

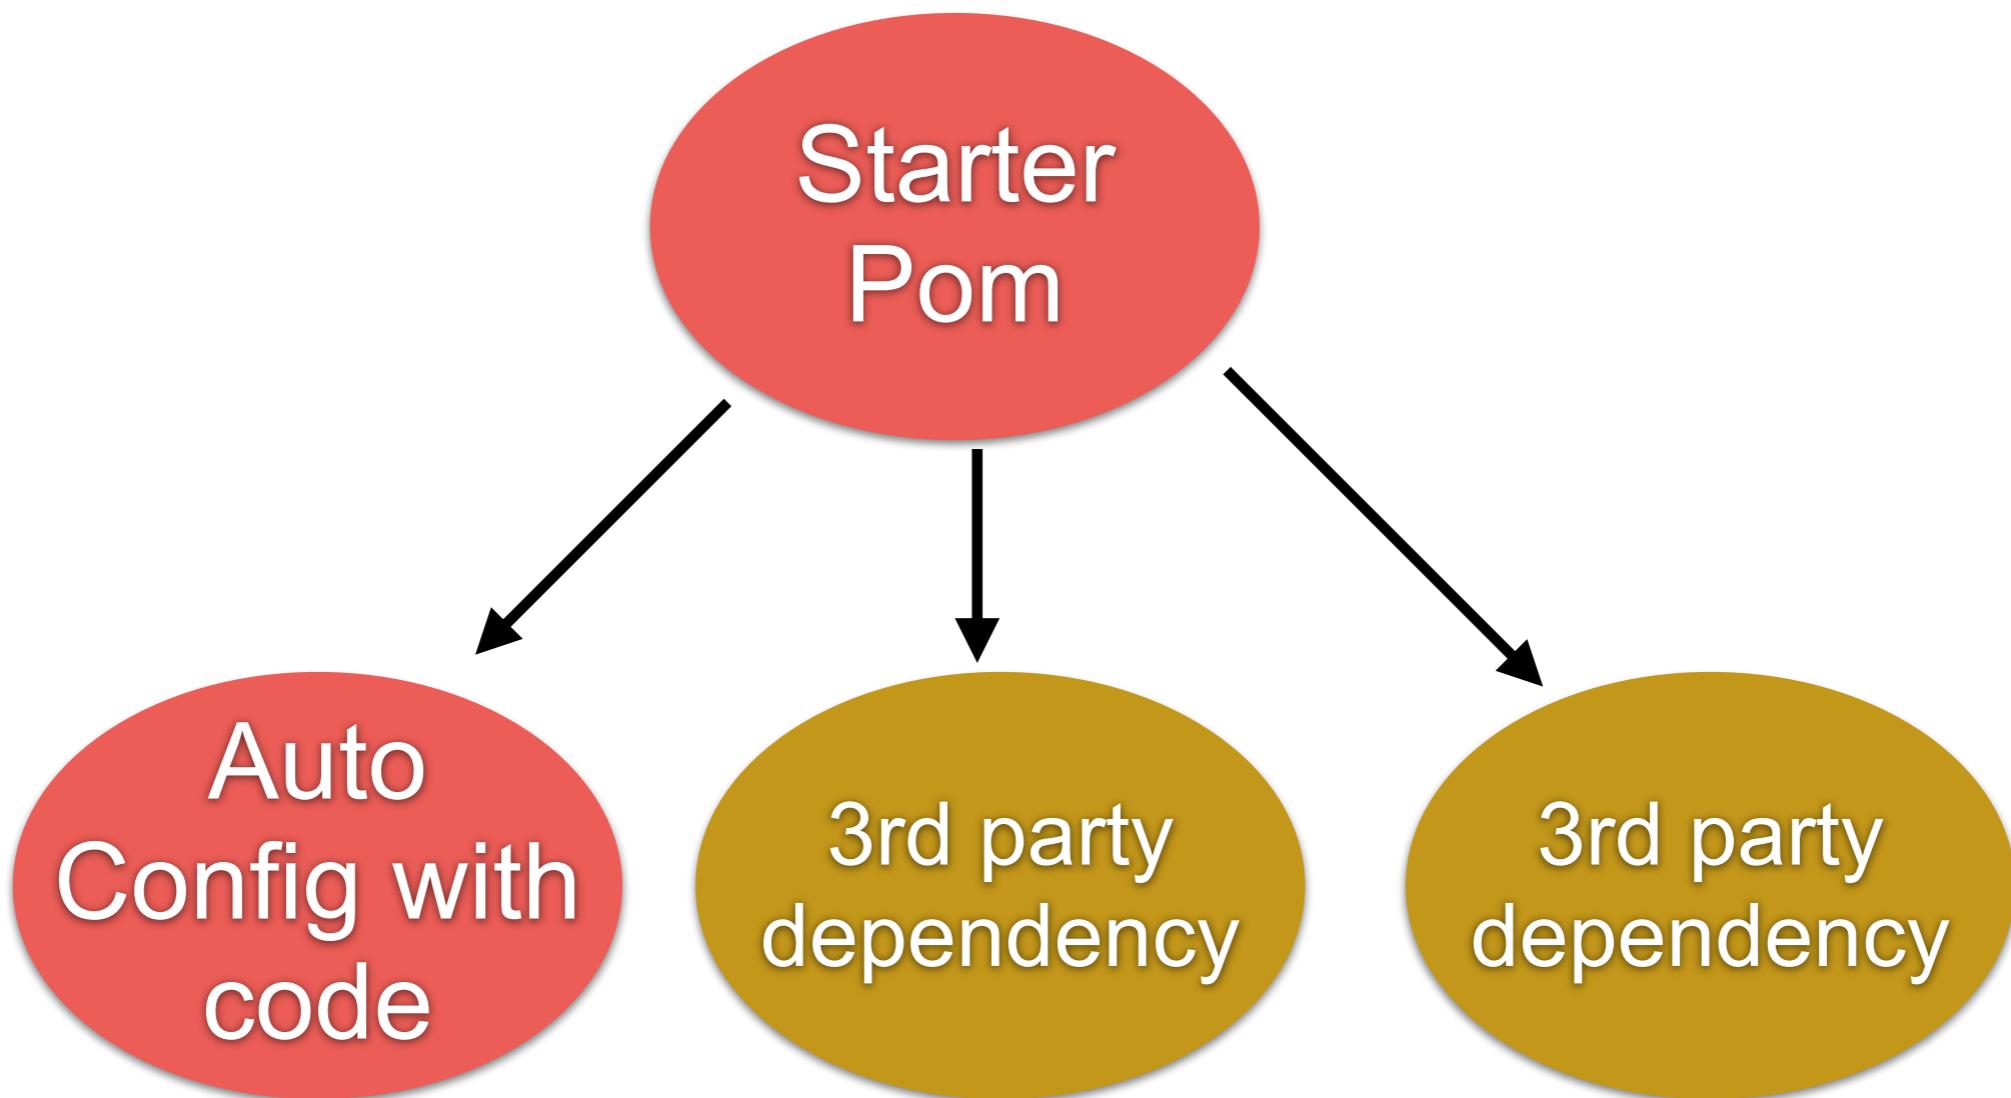

Disable banner

```
@SpringBootApplication
public class DemoApplication {

    public static void main(String[] args) {
        new SpringApplicationBuilder()
            .sources(DemoApplication.class)
            .bannerMode(Banner.Mode.OFF)
            .run(args);
    }
}
```

Anatomy of Starter

Configuration management

Properties/XML/YAML

Config server (App, Spring cloud config, git)

17 ways !!!

<https://docs.spring.io/spring-boot/docs/current/reference/html/boot-features-external-config.html>

Create project

Spring boot application

hello.HelloApplication.java

```
package hello;

import org.springframework.boot.SpringApplication;
import org.springframework.boot.autoconfigure.SpringBootApplication;

@SpringBootApplication
public class HelloApplication {

    public static void main(String[] args) {
        SpringApplication.run(HelloApplication.class, args);
    }

}
```

Spring Boot Structure

Separate by function/domain

Create model class

hello.model.Hello.java

```
package hello.domain;

public class Hello {

    private String message;

    public Hello(String message) {
        this.message = message;
    }

    public String getMessage() {
        return message;
    }

    public void setMessage(String message) {
        this.message = message;
    }
}
```

6. Create REST Controller

hello.controller.HelloController.java

```
package hello.controller;

import hello.domain.Hello;
import org.springframework.web.bind.annotation.GetMapping;
import org.springframework.web.bind.annotation.PathVariable;
import org.springframework.web.bind.annotation.RestController;

@RestController
public class HelloController {

    @GetMapping("/hello/{name}")
    public Hello sayHi(@PathVariable String name) {
        return new Hello("Hello " + name);
    }

}
```

7. Compile and Packaging

\$mvnw clean package

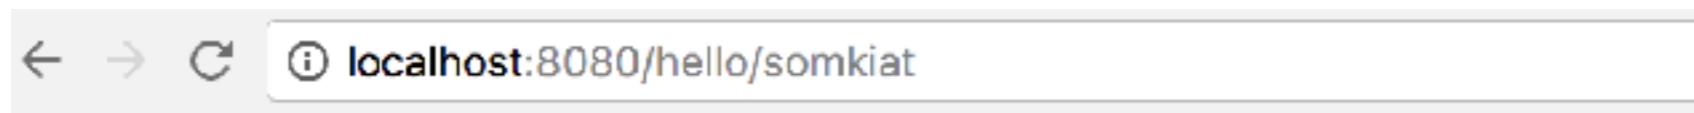

8. Run

```
$java -jar target/hello.jar
```

9. Open in browser

<http://localhost:8080/hello/somkiat>

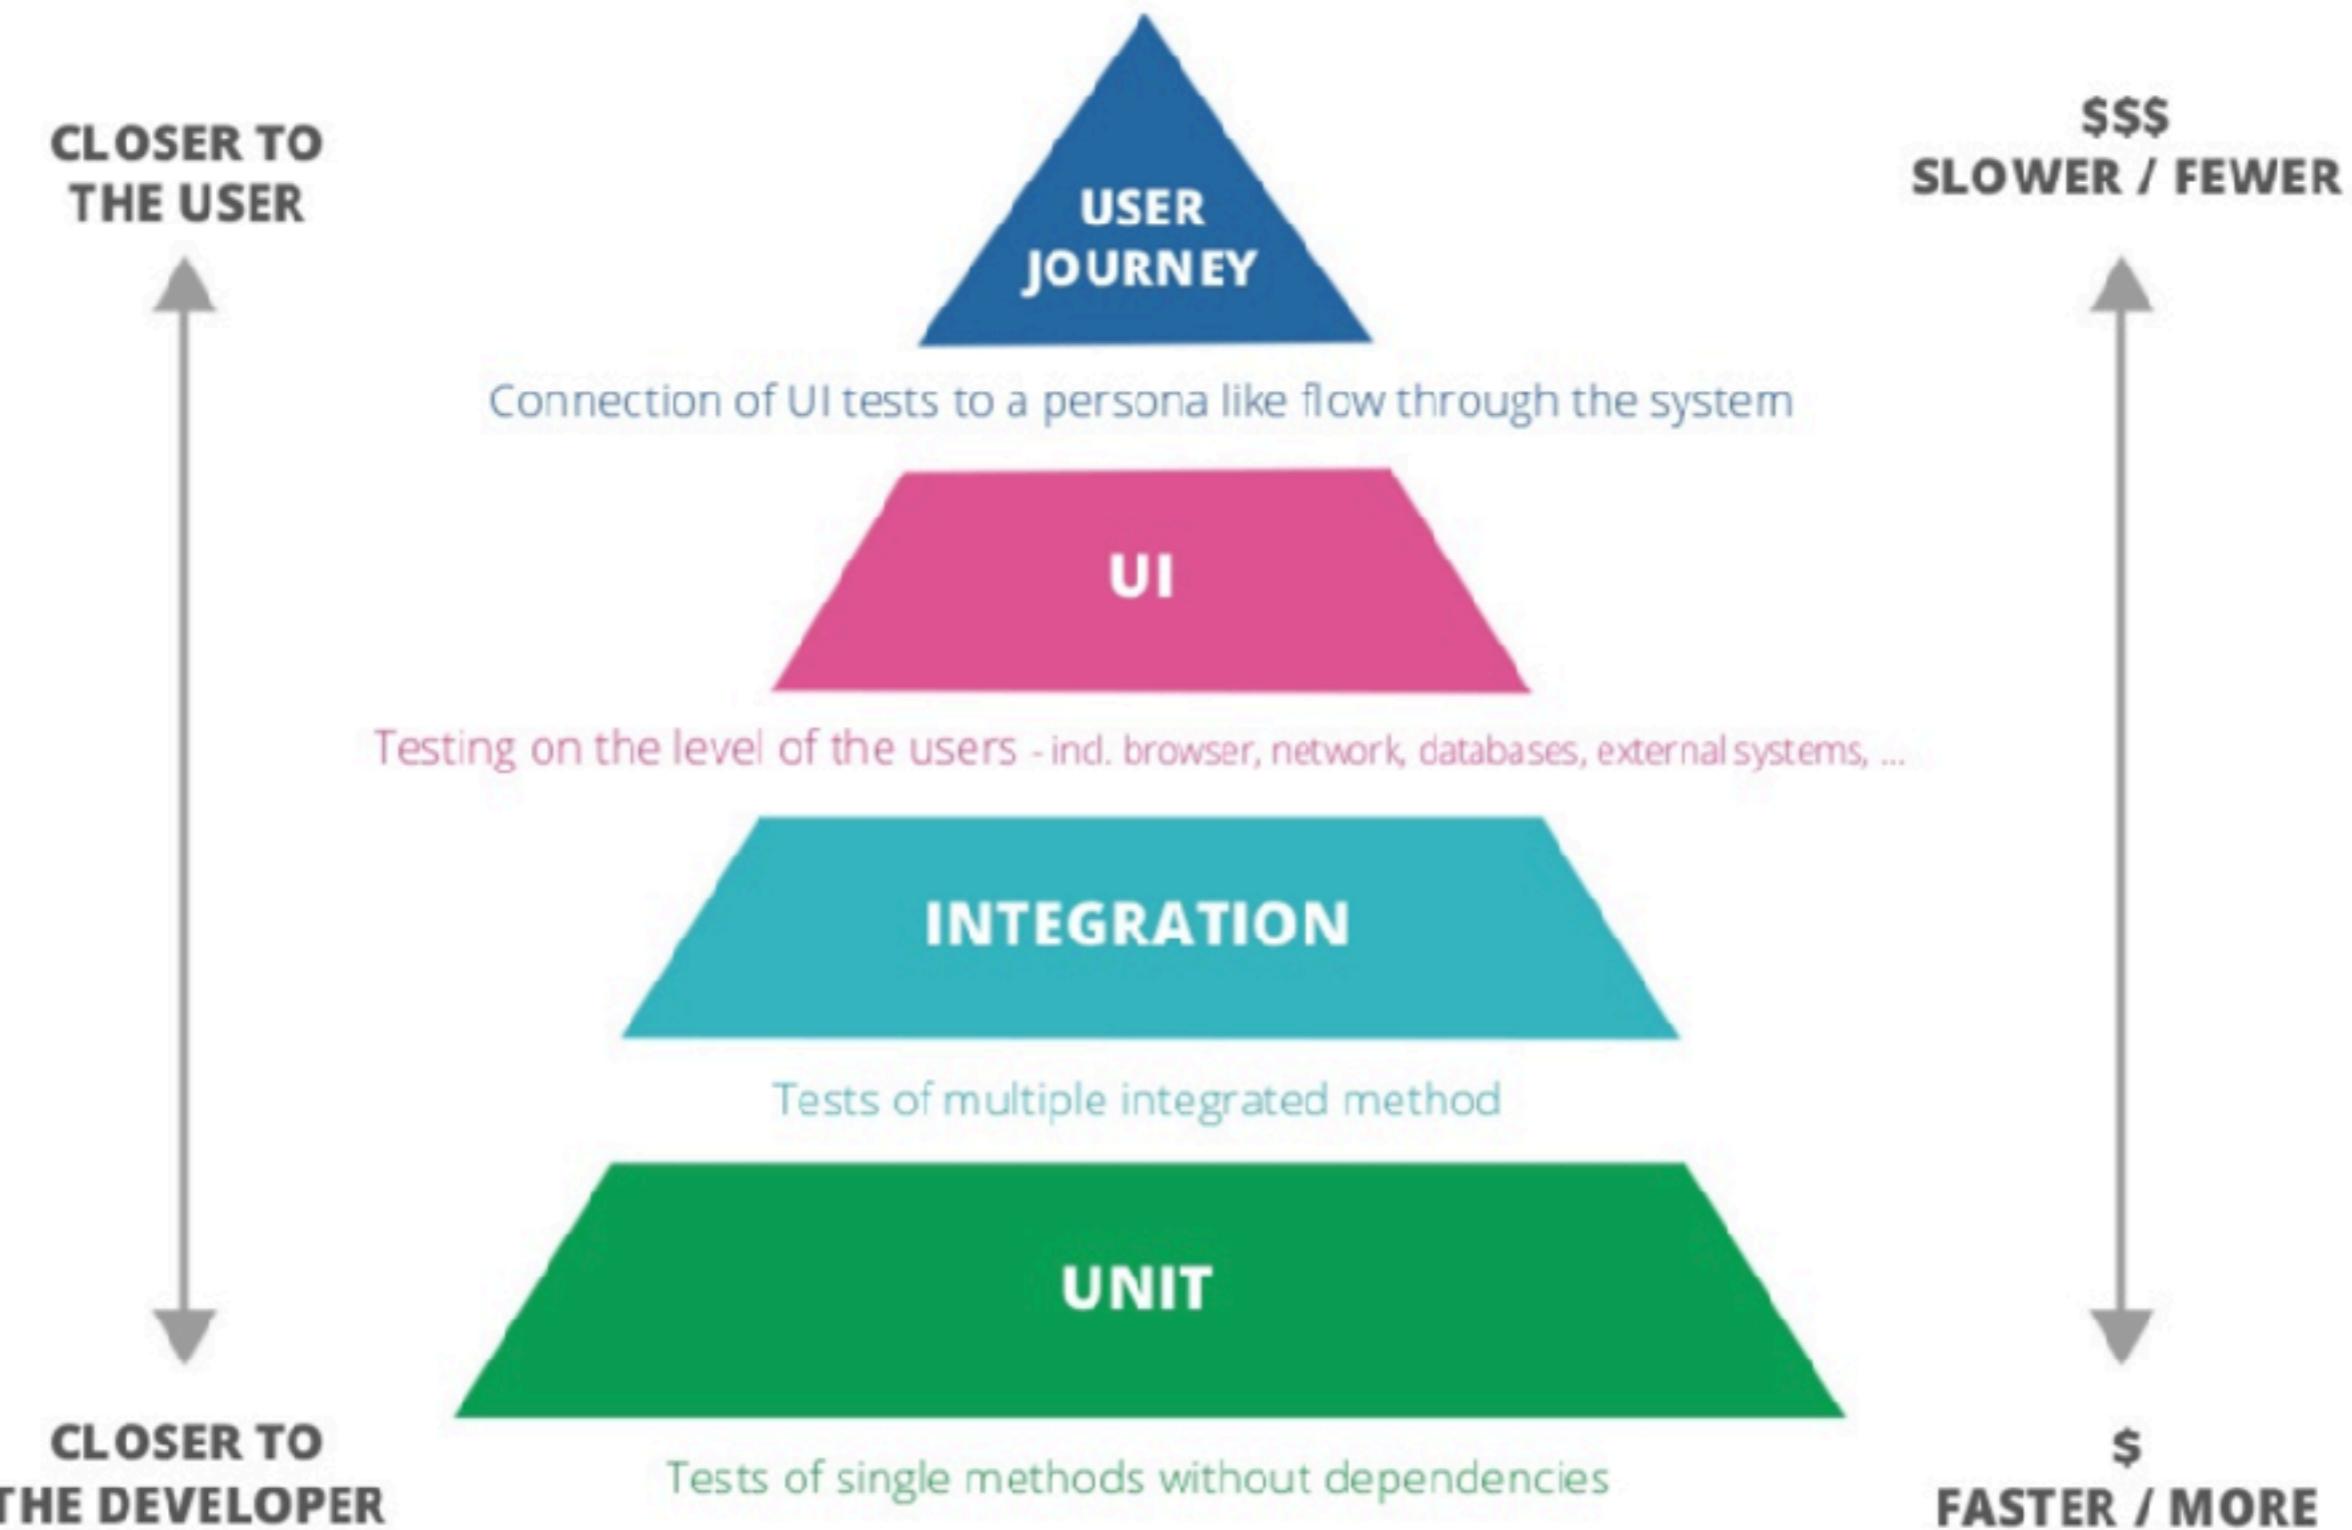

{ "message": "Hello somkiat" }

How to test the Hello service ?

Unit tests

How to use model ?

```
public class HelloTest {  
  
    @Test  
    public void success_to_create_model_with_constructor() {  
        Hello hello = new Hello("Somkiat");  
        assertEquals( expected: "Somkiat", hello.getMessage());  
    }  
  
}
```

API/Controller tests

How to use controller ?

Spring boot provides MockMvc to test Controller

```
package hello.controller;

import hello.domain.Hello;
import org.springframework.web.bind.annotation.GetMapping;
import org.springframework.web.bind.annotation.PathVariable;
import org.springframework.web.bind.annotation.RestController;

@RestController
public class HelloController {

    @GetMapping("/hello/{name}")
    public Hello sayHi(@PathVariable String name) {
        return new Hello("Hello " + name);
    }

}
```

API/Controller tests

```
@RunWith(SpringRunner.class)
@WebMvcTest/controllers = HelloController.class)
public class HelloControllerTest {

    @Autowired
    private MockMvc mockMvc;

    @Test
    public void shouldReturnHelloSomkiat() throws Exception {
        mockMvc.perform(get(urlTemplate: "/hello/somkiat"))
            .andExpect(jsonPath(expression: "$.message")
                .value(expectedValue: "Hello somkiat"))
            .andExpect(status().is2xxSuccessful());
    }

}
```

API/Controller tests

With Spring Boot Testing + TestRestTemplate

```
@RunWith(SpringRunner.class)
@SpringBootTest(
    webEnvironment = WebEnvironment.RANDOM_PORT)
public class AccountControllerTest {

    @Autowired
    private TestRestTemplate testRestTemplate;

    @Autowired
    private AccountRepository accountRepository;

    @Before
    public void initData() {
        accountRepository.save(new Account("01"));
        accountRepository.save(new Account("02"));
    }
}
```

API/Controller tests

With Spring Boot Testing + TestRestTemplate

```
@Test  
public void  
    เรียกข้อมูลบัญชีของหมายเลข_0868696209_ต้องเจอสองบัญชีนั่น () {  
    List<AccountResponse> accountResponses  
        = testRestTemplate.getForObject(  
            "/account/0868696209", List.class);  
  
    assertEquals(2, accountResponses.size());  
}
```

Compile with testing

\$mvn clean package

```
[INFO]
[INFO] Results:
[INFO]
[INFO] Tests run: 2, Failures: 0, Errors: 0, Skipped: 0
[INFO]
[INFO]
```

% of Code/Test coverage

Add coverage to pom.xml (1)

```
<build>
    <finalName>hello</finalName>
    <plugins>
        <plugin>
            <groupId>org.springframework.boot</groupId>
            <artifactId>spring-boot-maven-plugin</artifactId>
        </plugin>

        <plugin>
            <artifactId>maven-compiler-plugin</artifactId>
            <version>2.5.1</version>
            <configuration>
                <source>${java.version}</source>
                <target>${java.version}</target>
                <encoding>${project.build.sourceEncoding}</encoding>
            </configuration>
        </plugin>
    </plugins>
</build>
```

Add coverage to pom.xml (2)

```
<plugin>
  <groupId>org.codehaus.mojo</groupId>
  <artifactId>cobertura-maven-plugin</artifactId>
  <version>2.7</version>
  <configuration>
    <formats>
      <format>html</format>
      <format>xml</format>
    </formats>
  </configuration>
  <executions>
    <execution>
      <phase>package</phase>
      <goals>
        <goal>cobertura</goal>
      </goals>
    </execution>
  </executions>
  <dependencies>
    <dependency>
      <groupId>org.ow2.asm</groupId>
      <artifactId>asm</artifactId>
      <version>5.0.3</version>
    </dependency>
  </dependencies>
</plugin>
```

Run test again

How to improve % of coverage ?

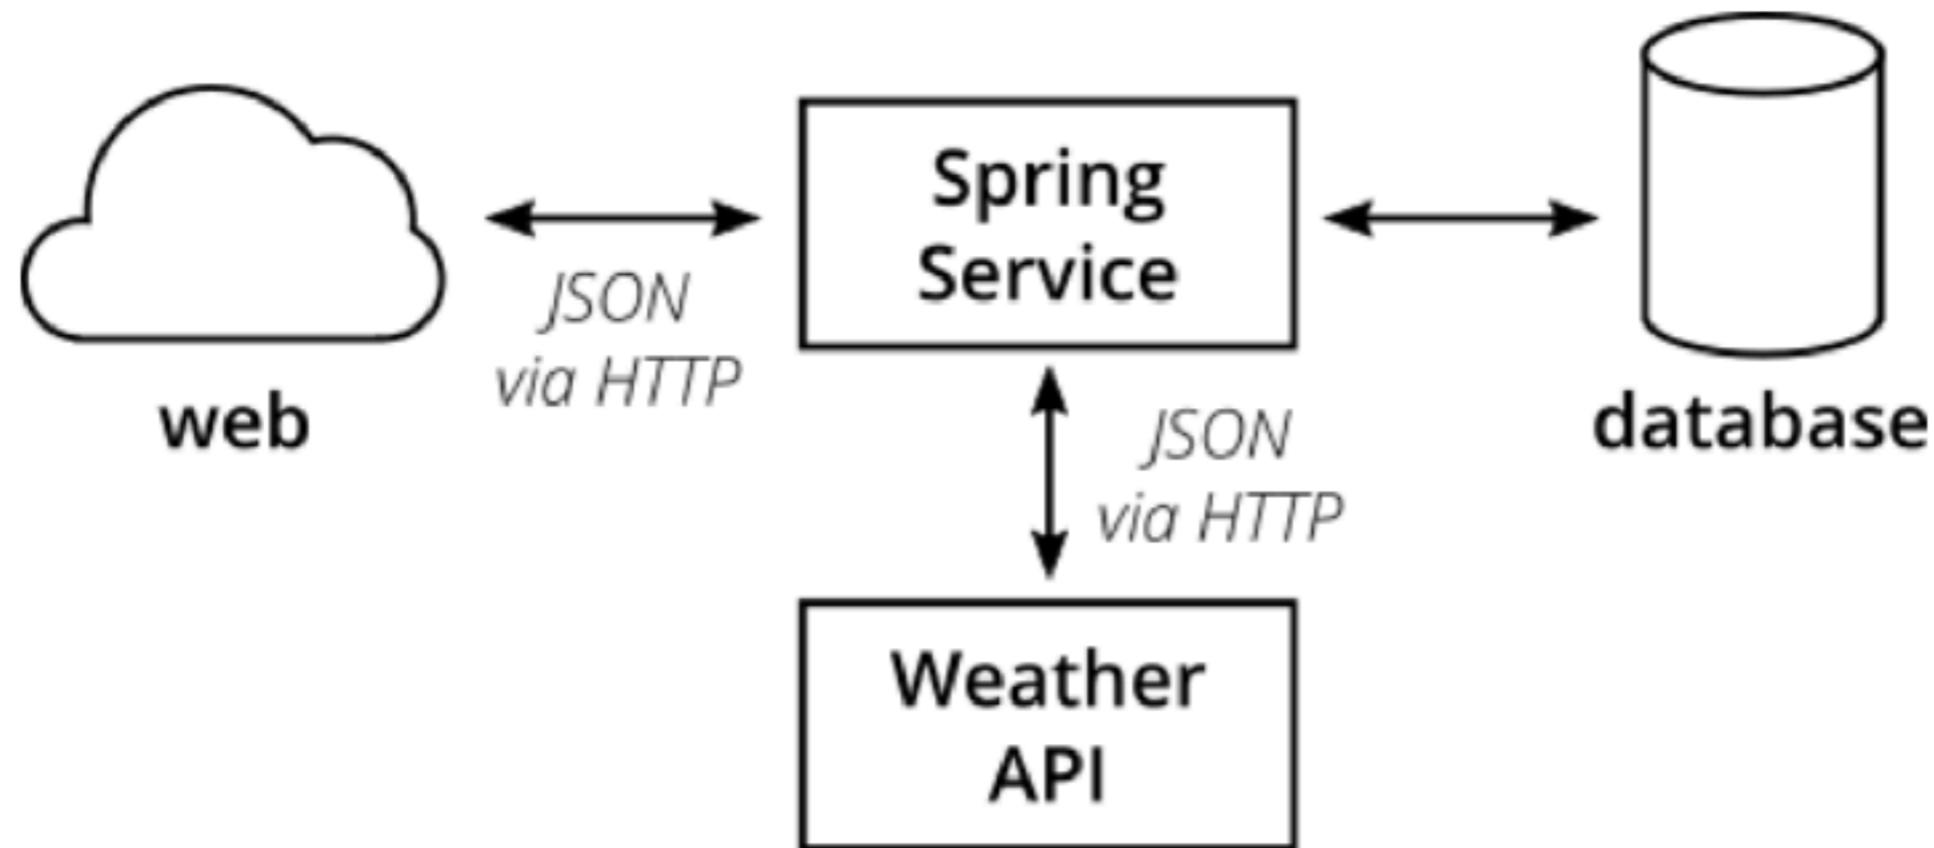

Service Structure

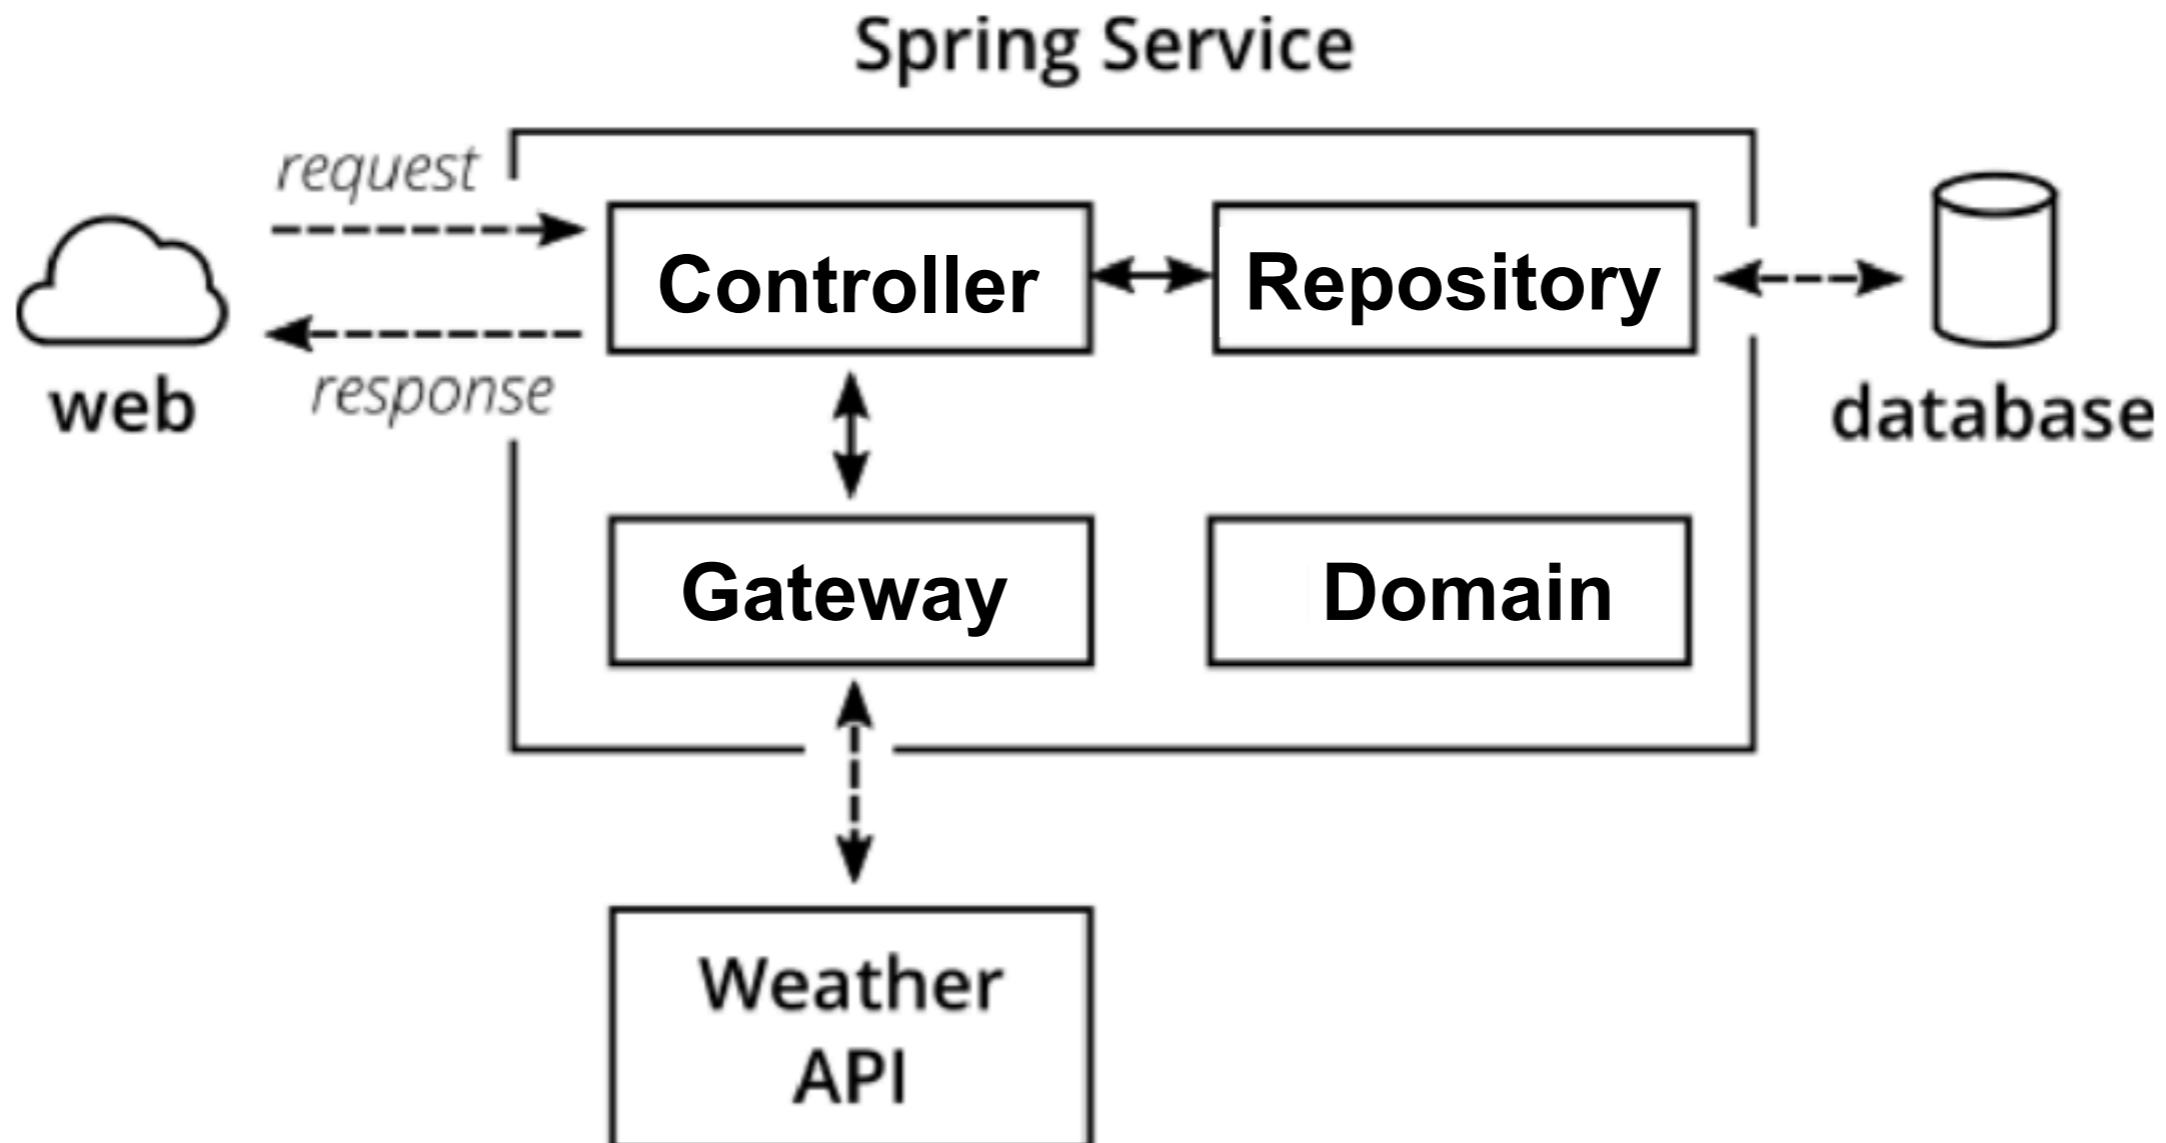

Service Structure

Sample application

Project structure

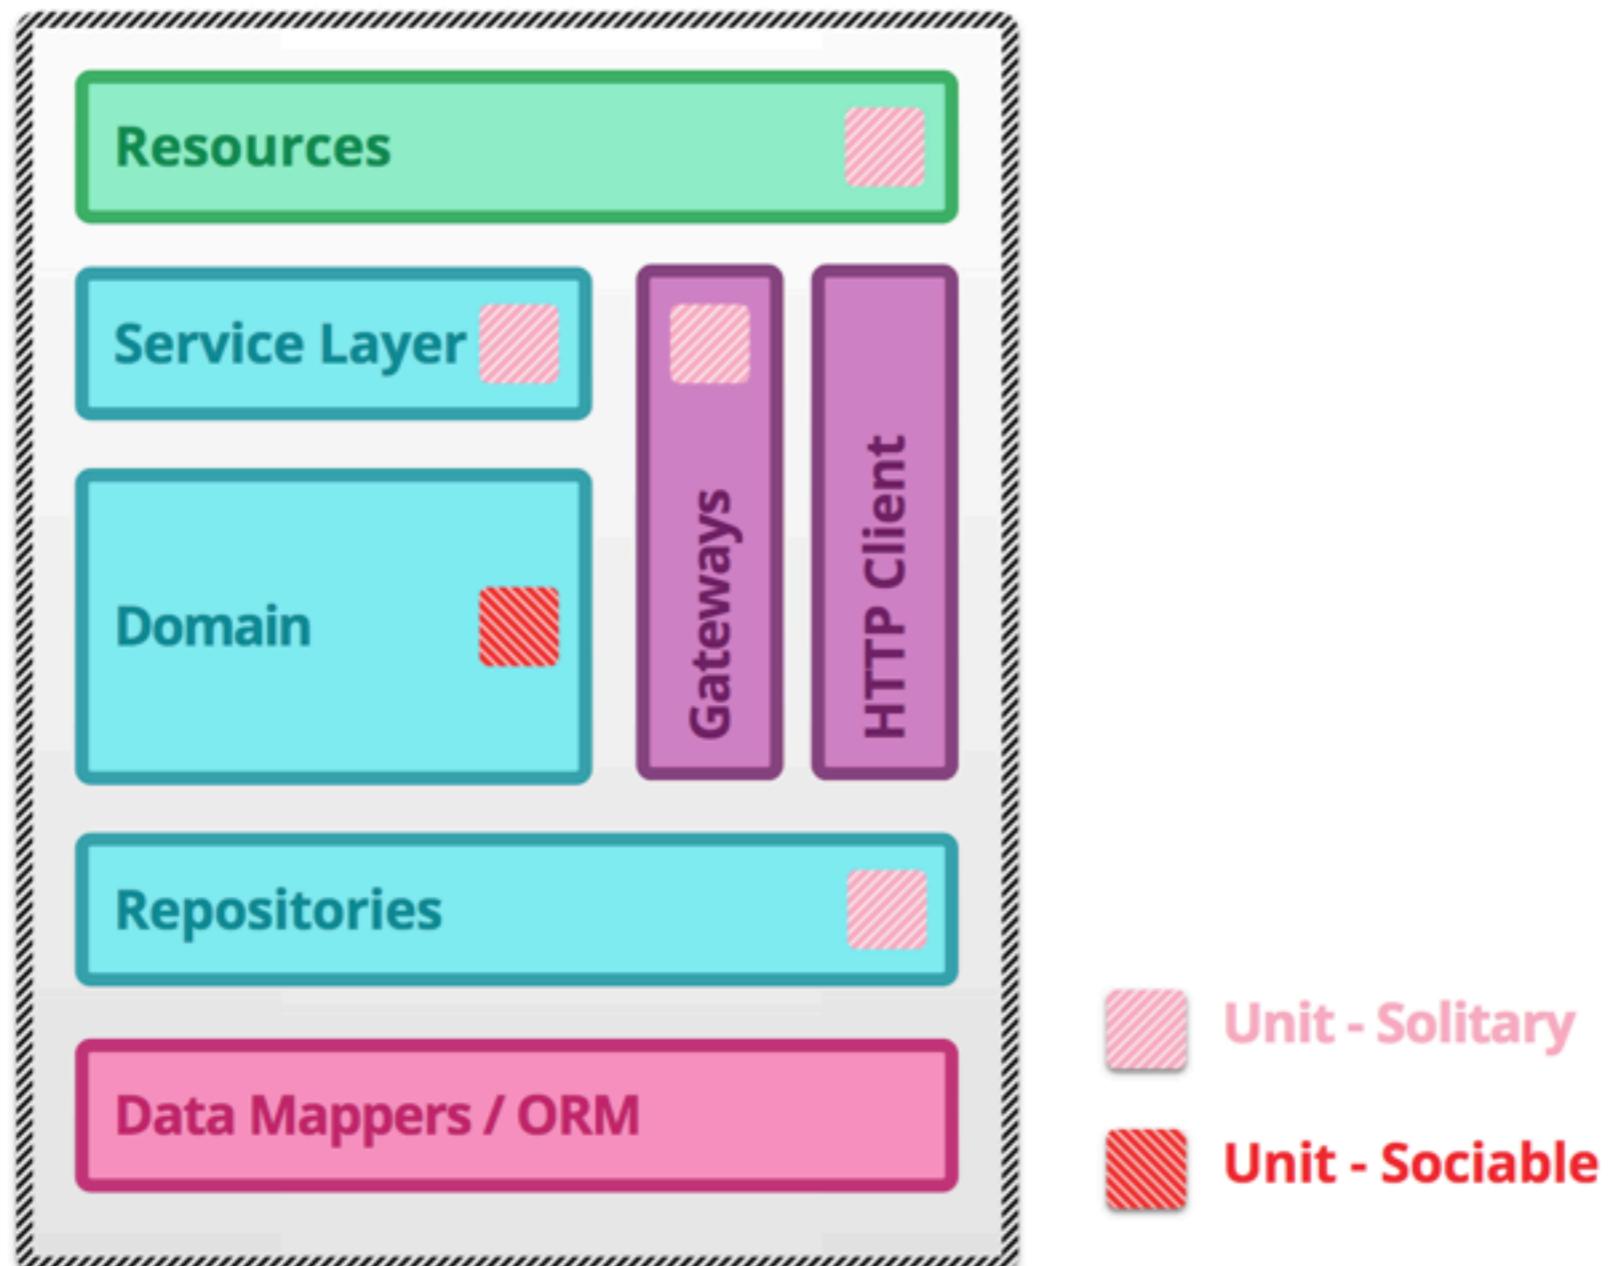

How to test ?

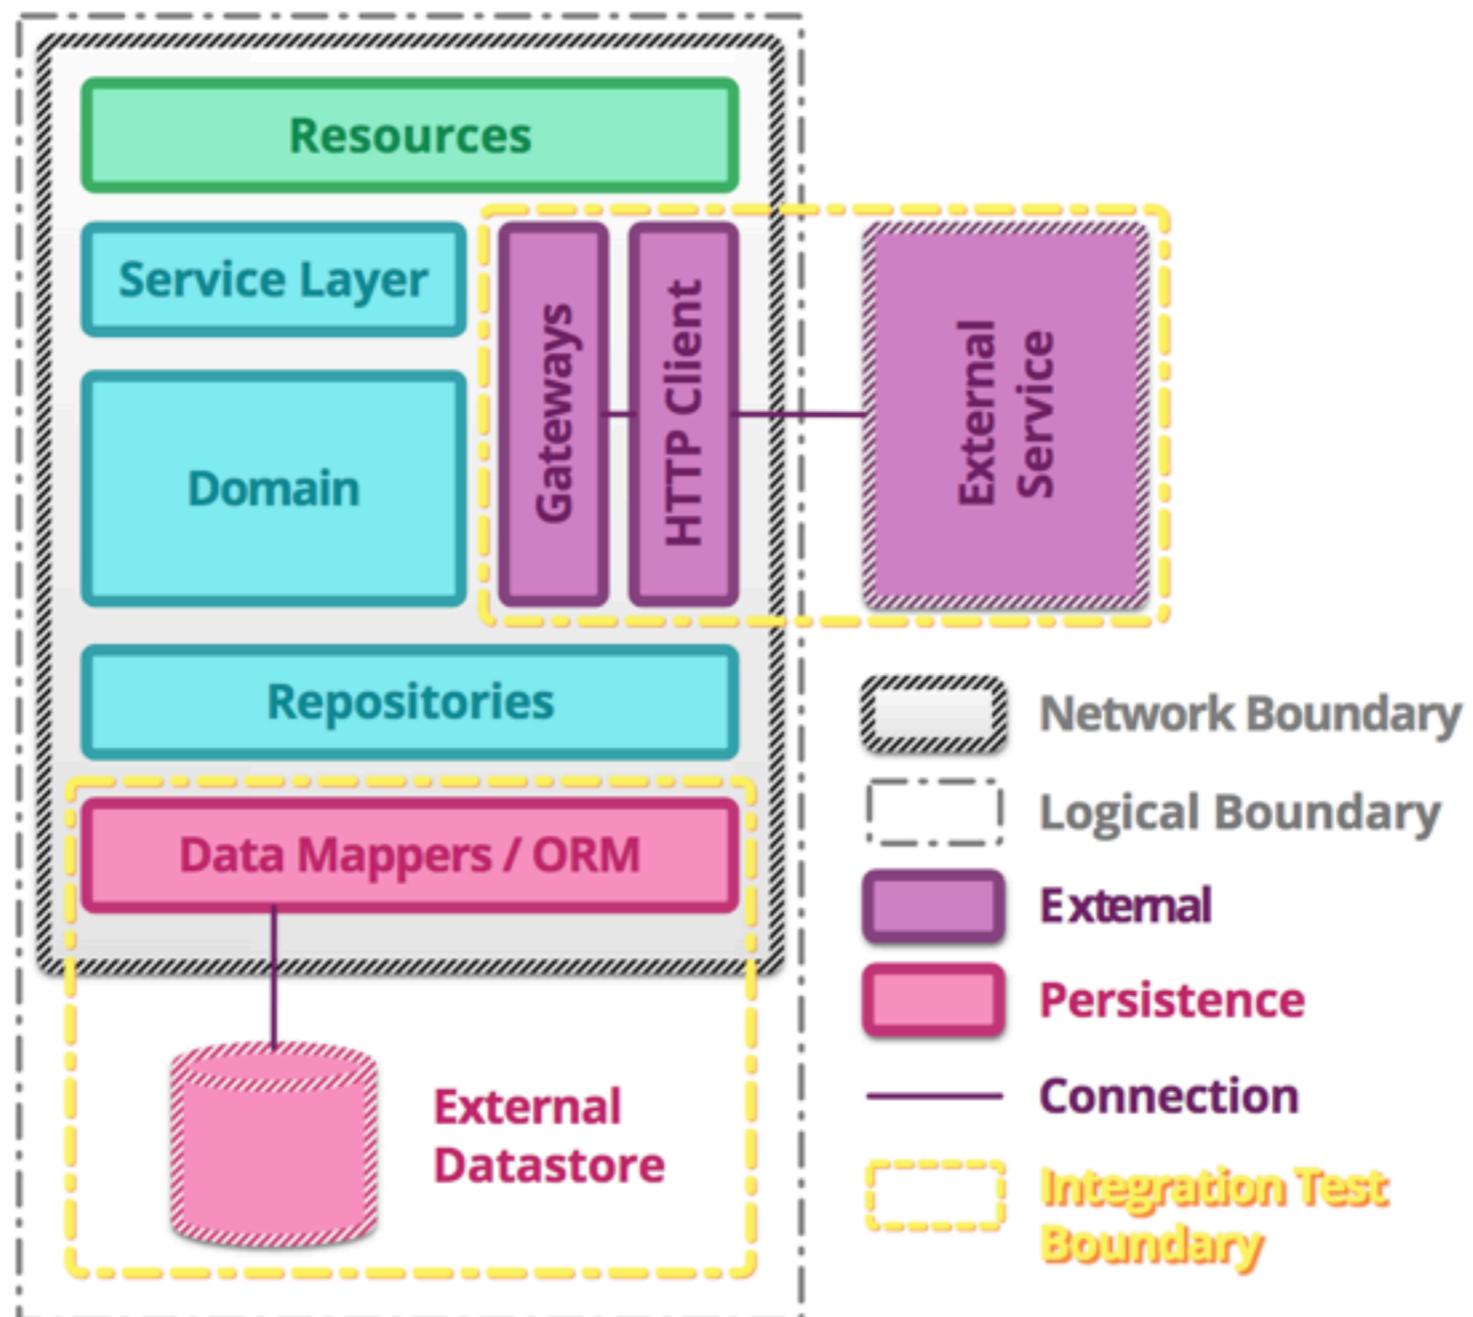

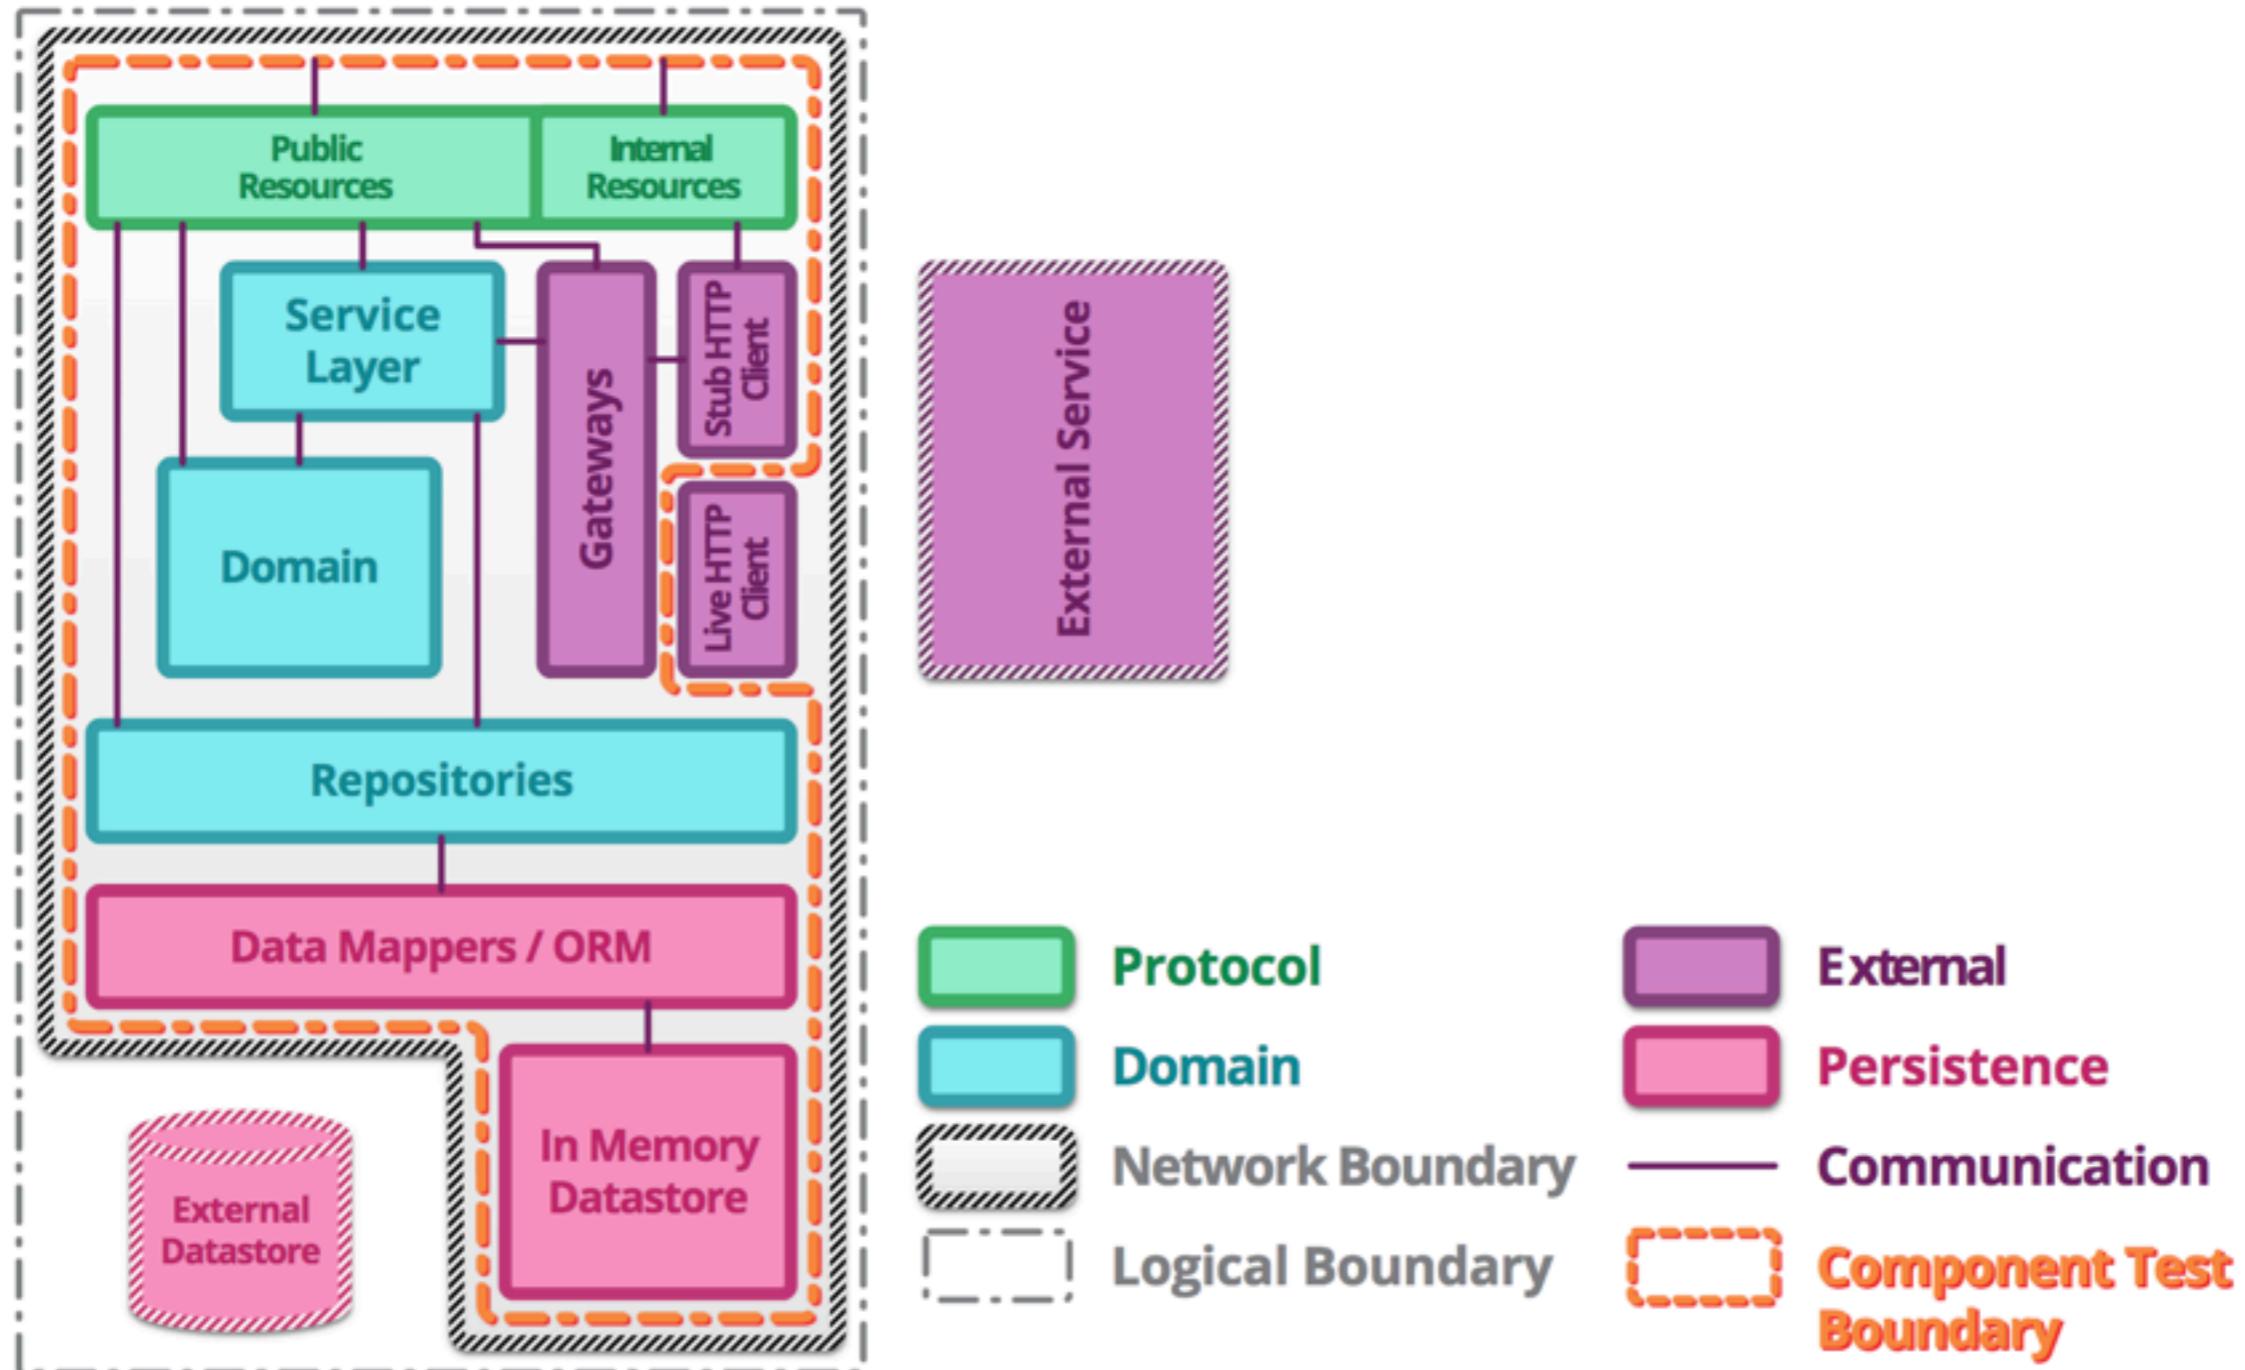

Unit testing

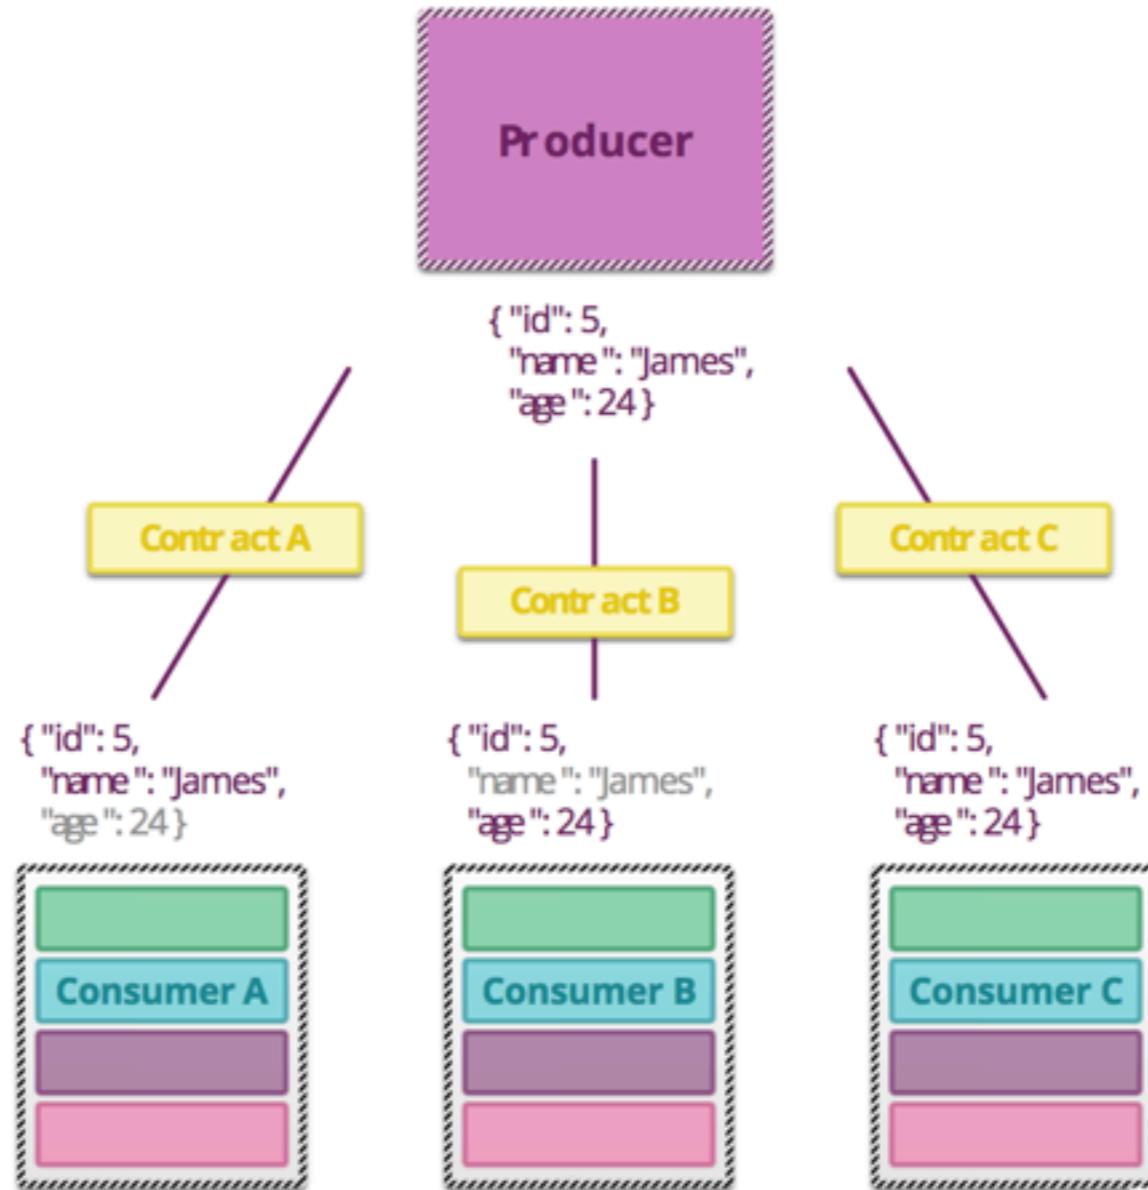

Integration testing

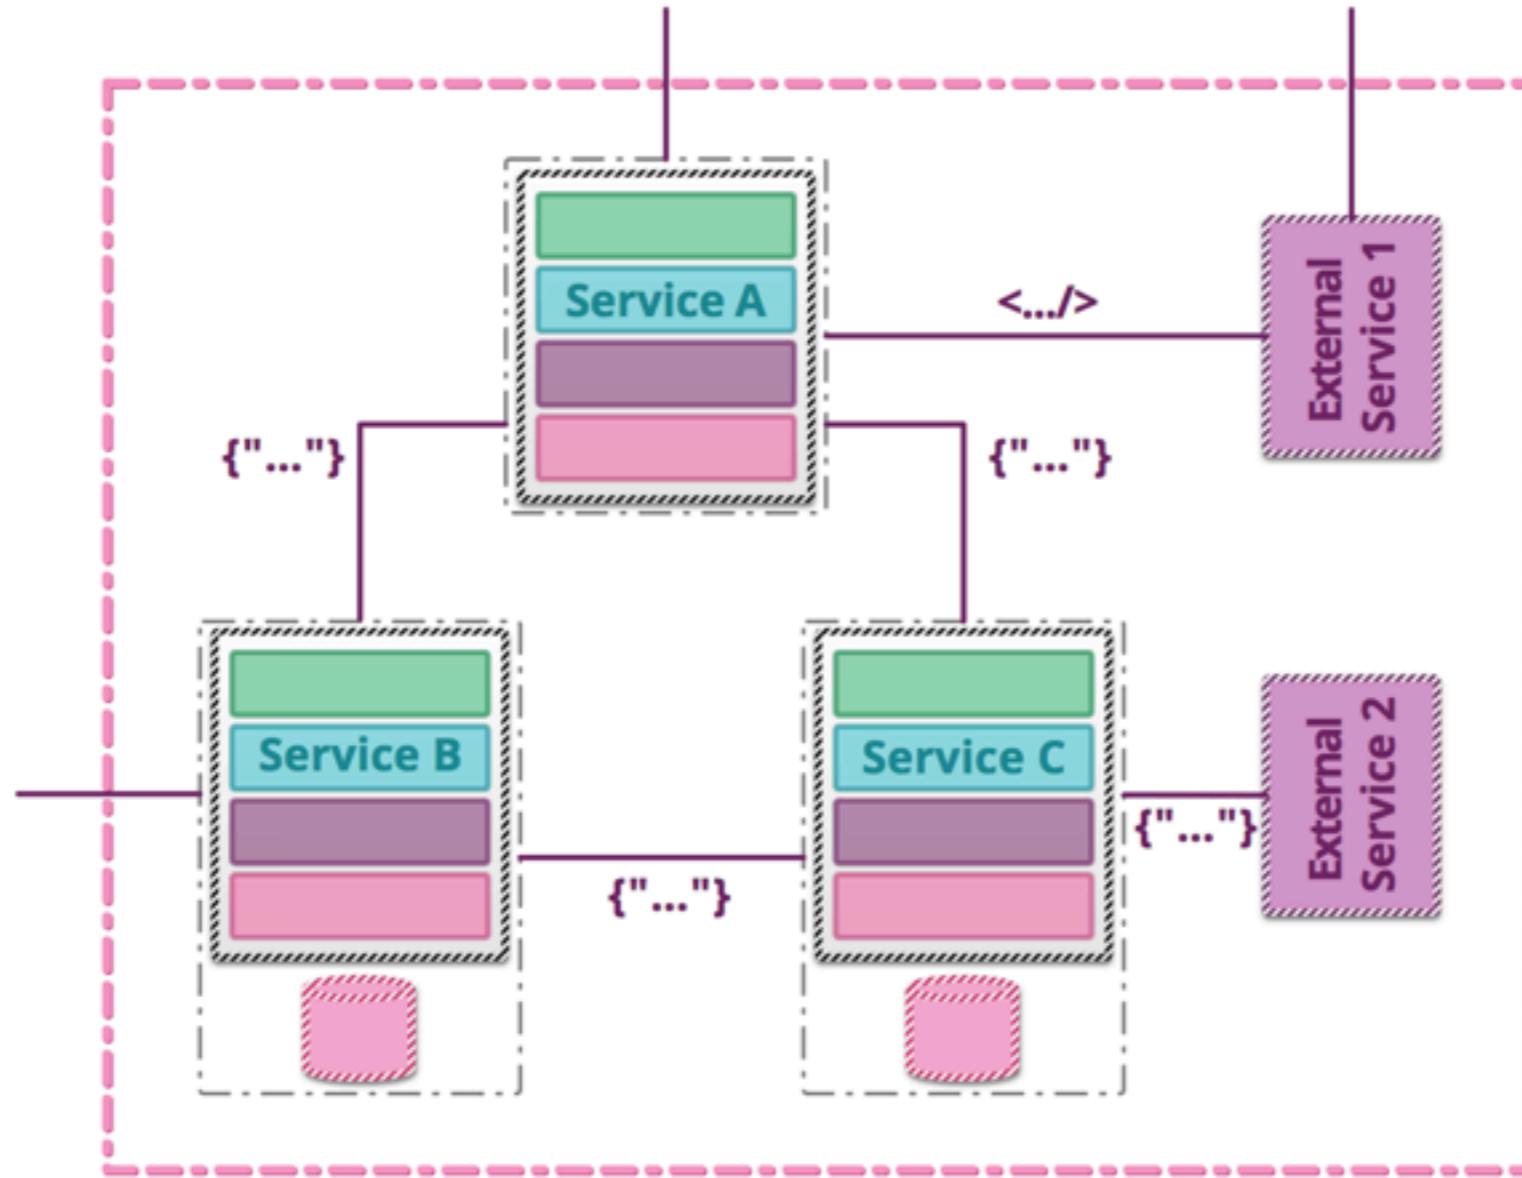

Component testing

Contract testing

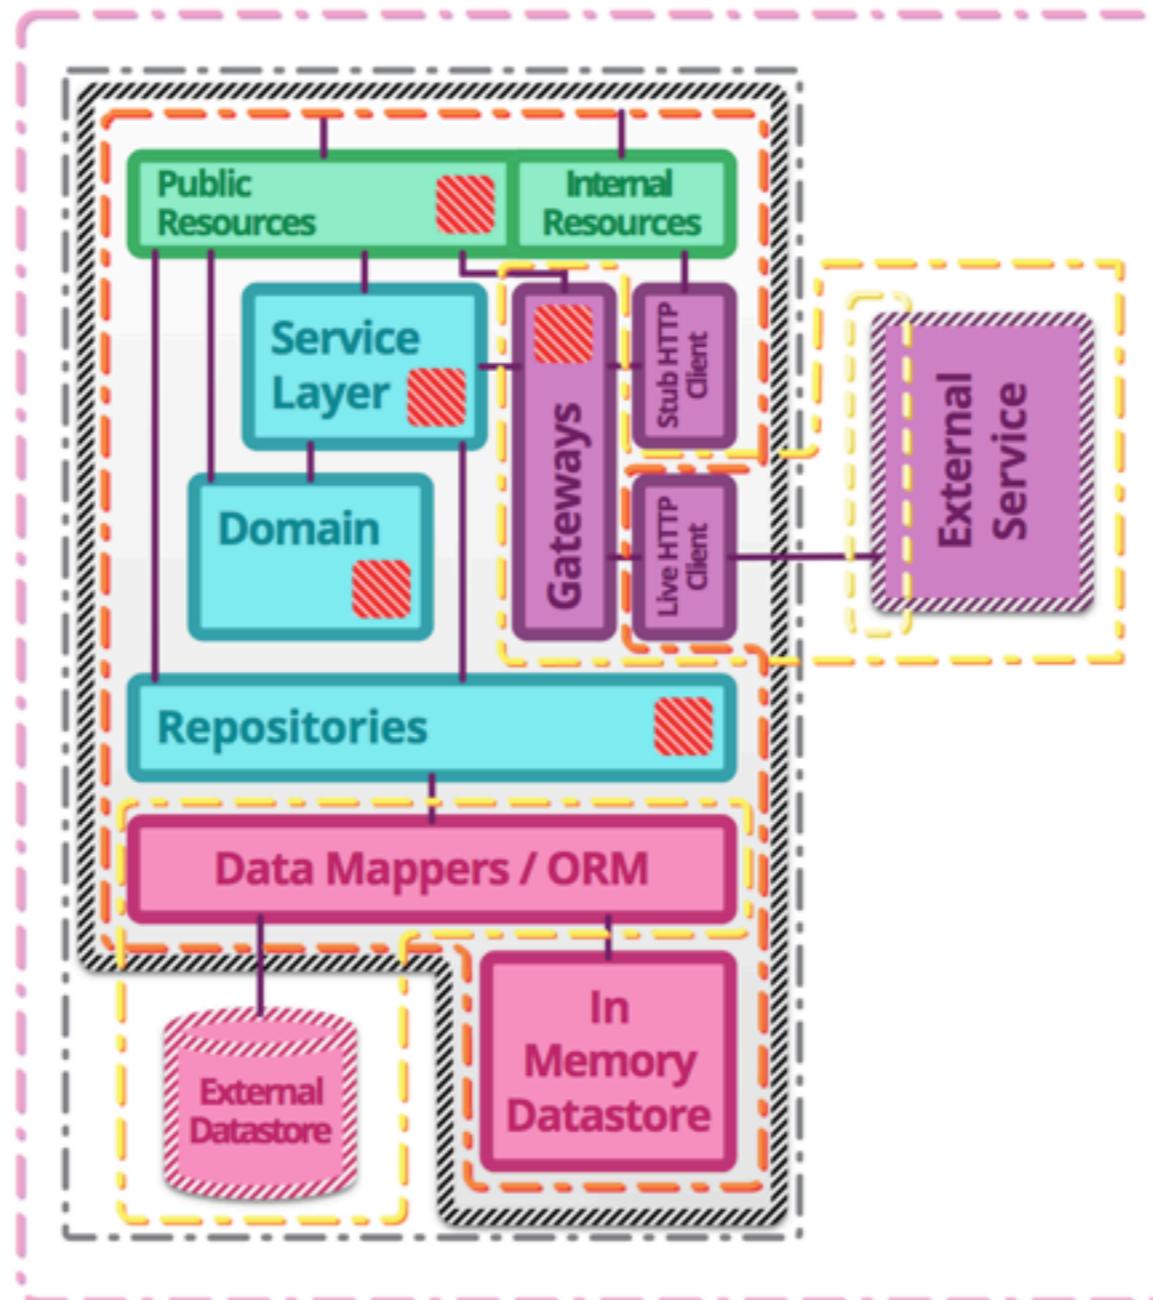

End-to-End testing

Summary

 **Unit tests** : exercise the smallest pieces of testable software in the application to determine whether they behave as expected.

 **Integration tests** : verify the communication paths and interactions between components to detect interface defects.

 **Component tests** : limit the scope of the exercised software to a portion of the system under test, manipulating the system through internal code interfaces and using test doubles to isolate the code under test from other components.

 **Contract tests** : verify interactions at the boundary of an external service asserting that it meets the contract expected by a consuming service.

 **End-to-end tests** : verify that a system meets external requirements and achieves its goals, testing the entire system, from end to end.

Let's workshop with Repository

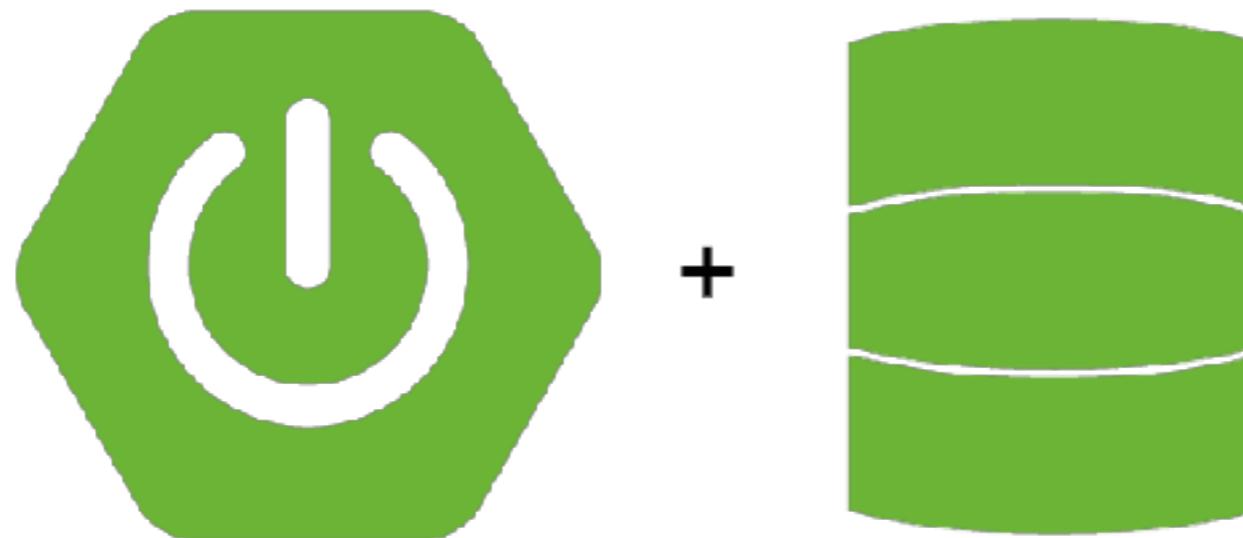

Working with repository

Working with repository

We're using Spring Data

Modify pom.xml

Add library of Spring Data

```
<dependency>
    <groupId>org.springframework.boot</groupId>
    <artifactId>spring-boot-starter-data-jpa</artifactId>
</dependency>
```

Modify pom.xml

Add library of Persistence/data store

```
<dependency>
    <groupId>org.postgresql</groupId>
    <artifactId>postgresql</artifactId>
    <version>42.1.1</version>
</dependency>
```

Add data store config

In src/main/resources

```
spring.datasource.url= jdbc:postgresql://127.0.0.1:15432/postgres
spring.datasource.username= user
spring.datasource.password= password
spring.datasource.platform= POSTGRESQL

spring.jpa.show-sql= true
spring.jpa.hibernate.ddl-auto= create-drop
spring.jpa.database-platform= org.hibernate.dialect.PostgreSQLDialect
```

Create repository interface

hello.repository.PersonRepository.java

```
public interface PersonRepository  
    extends CrudRepository<Person, String> {  
  
    Optional<Person> findByFirstName(String name);  
}
```

Create Entity class

hello.repository.Person.java

```
@Entity
public class Person {

    @Id
    @GeneratedValue(strategy = GenerationType.AUTO)
    private int id;
    private String firstName;
    private String lastName;

    public Person() {
    }

    public Person(String firstName, String lastName) {
        this.firstName = firstName;
        this.lastName = lastName;
    }
}
```

Create new controller

hello.repository.HelloControllerWithRepository.java

```
public class HelloControllerWithRepository {  
  
    private final PersonRepository personRepository;  
  
    @Autowired  
    public HelloControllerWithRepository(PersonRepository personRepository) {  
        this.personRepository = personRepository;  
    }  
  
    @GetMapping("/hello/data/{name}")  
    public Hello sayHi(@PathVariable String name) {  
        Optional<Person> foundPerson = personRepository.findByName(name);  
        String result = foundPerson  
            .map(person -> String.format("Hello %s", person.getFirstName()))  
            .orElse( other: "Data not found");  
        return new Hello(result);  
    }  
}
```

Run test and package

\$mvn clean package

Cobertura Report generation was successful.

Cobertura 2.1.1 - GNU GPL License (NO WARRANTY) - See COPYRIGHT file

Cobertura: Loaded information on 3 classes.

time: 125ms

Cobertura Report generation was successful.

BUILD SUCCESS

Run your application

```
$java -jar target/hello.jar
```

Coverage report

How to test ?

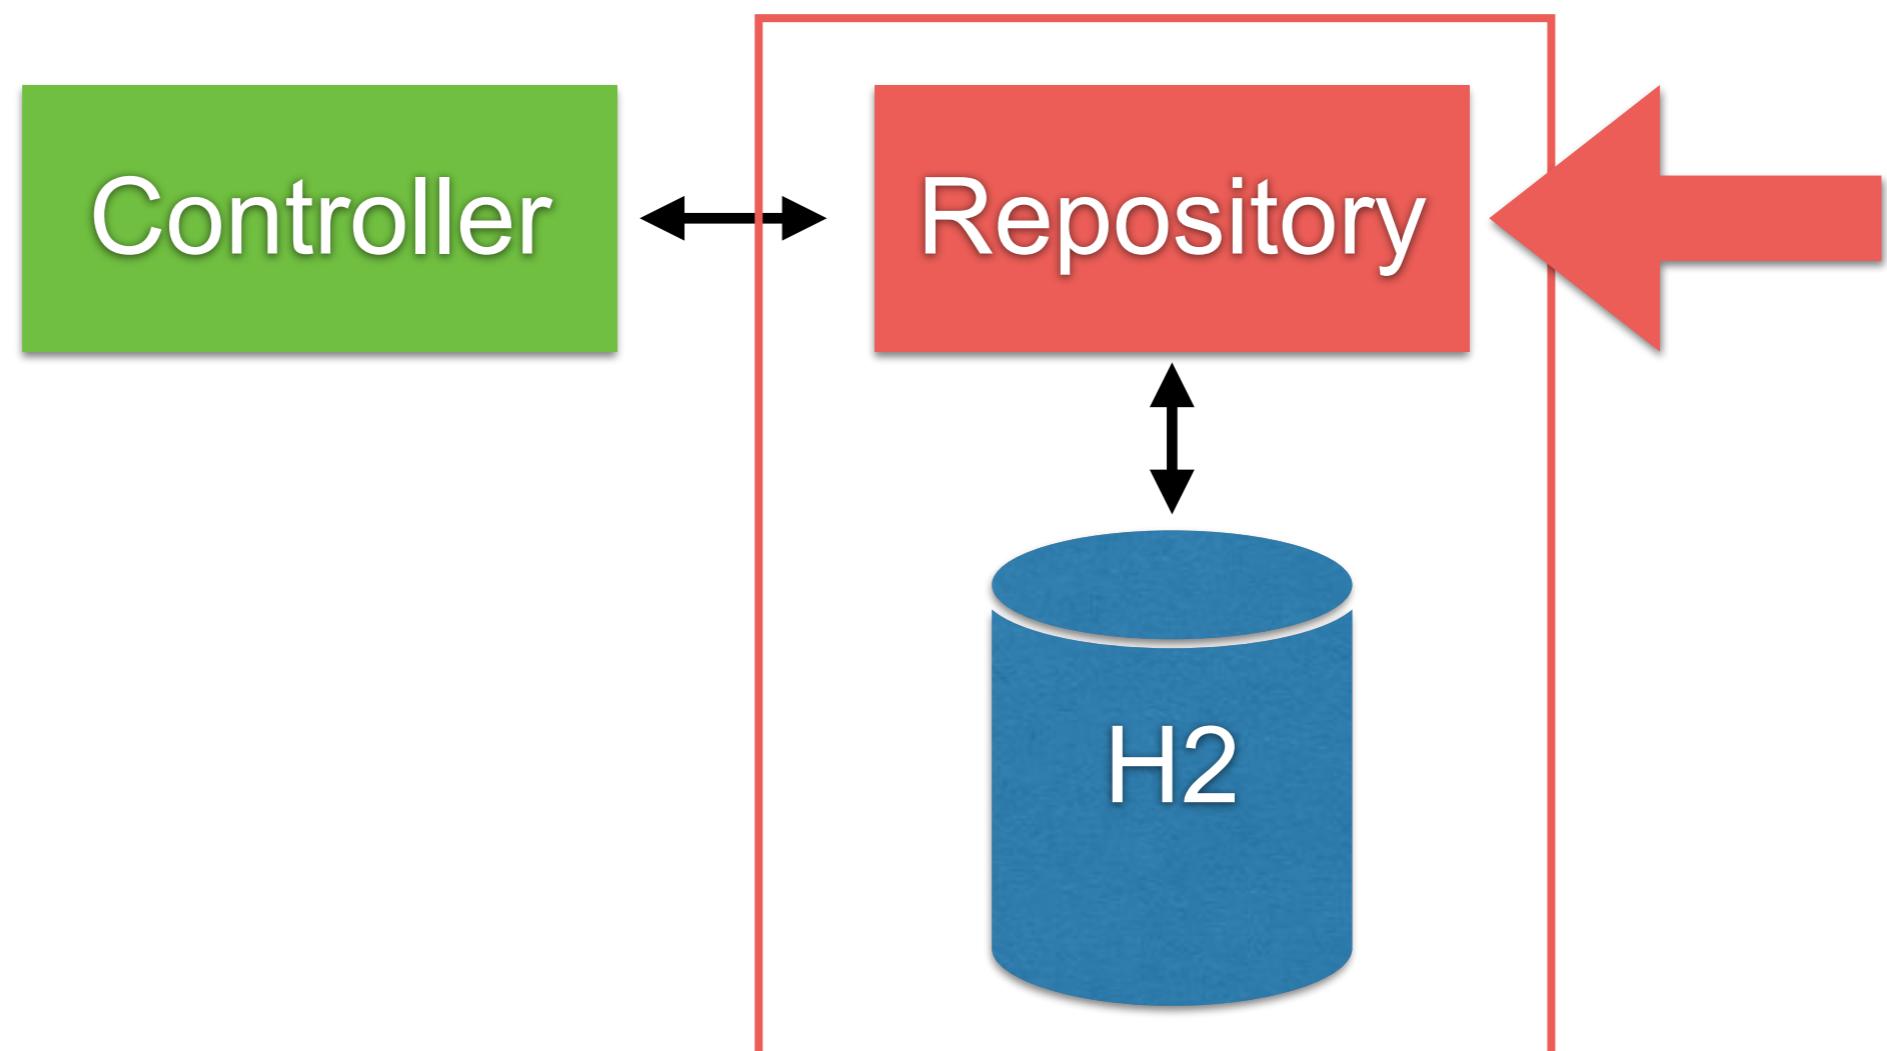

How to test with Repository ?

Repository Testing

Using `@DataJpaTest`

Spring Testing

Spring boot provide DataJpaTest

should be add H2 library to pom.xml

```
<dependency>
    <groupId>com.h2database</groupId>
    <artifactId>h2</artifactId>
    <scope>test</scope>
</dependency>
```

Repository Testing (1)

```
@RunWith(SpringRunner.class)
@DataJpaTest
public class PersonRepositoryTest {

    @Autowired
    private PersonRepository personRepository;

    @After
    public void clearData() {
        personRepository.deleteAll();
    }
}
```

Repository Testing (2)

Add a test case

```
@Test  
public void shouldSaveAndGetData() throws Exception {  
    //Arrange  
    Person somkiat = new Person("somkiat", "pui");  
    personRepository.save(somkiat);  
  
    Optional<Person> shouldSomkiat  
        = personRepository.findByFirstName("somkiat");  
  
    assertEquals(expected: "somkiat",  
        shouldSomkiat.get().getFirstName());  
}
```

Run test and package

\$mvn clean package

Cobertura Report generation was successful.

Working with Real Database

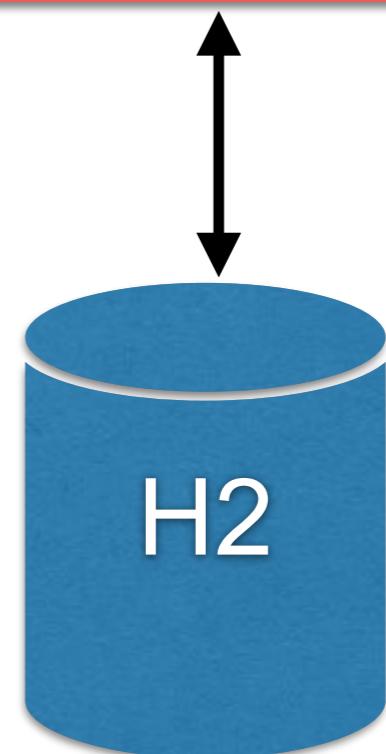

Working with Database

Production

Testing

Initial database 1

Using @PostConstruct

```
@PostConstruct  
public void initData() {  
    Account account1 = new Account();  
    account1.setAccountId("01");  
    accountRepository.save(account1);  
    Account account2 = new Account();  
    account2.setAccountId("02");  
    accountRepository.save(account2);  
}
```

Initial database 2

Schema (resources/schema.sql)

Data (resources/data.sql)

Schema.sql

```
CREATE TABLE account(
    id BIGINT AUTO_INCREMENT PRIMARY KEY,
    account_Id VARCHAR(16) NOT NULL UNIQUE,
    mobile_No VARCHAR(10),
    name VARCHAR(50),
    account_Type CHAR(2)
);
```

Data.sql

```
INSERT INTO account (account_Id) VALUES ('01');
INSERT INTO account (account_Id) VALUES ('02');
```

Initial database 2

Disable auto generate DDL from JPA in file application.yml

```
spring:  
  jpa:  
    show-sql: true  
    hibernate:  
      ddl-auto: none
```

Initial database 2

Problem with naming strategy !!

```
spring:  
  jpa:  
    show-sql: true  
    hibernate:  
      ddl-auto: none  
      naming:  
        physical-strategy:  
          org.springframework.boot.orm.jpa.hibernate.SpringPhysicalNamingStrategy  
        implicit-strategy:  
          org.springframework.boot.orm.jpa.hibernate.SpringImplicitNamingStrategy
```

<https://github.com/spring-projects/spring-boot/tree/master/spring-boot-project/spring-boot/src/main/java/org/springframework/boot/orm/jpa/hibernate>

Run and see from logging

Execute file schema.sql and data.sql

```
o.s.jdbc.datasource.init.ScriptUtils : Executing SQL script from URL [file:/Users/somkiat/dat  
o.s.jdbc.datasource.init.ScriptUtils : Executed SQL script from URL [file:/Users/somkiat/data  
49 ms.  
o.s.jdbc.datasource.init.ScriptUtils : Executing SQL script from URL [file:/Users/somkiat/dat  
o.s.jdbc.datasource.init.ScriptUtils : Executed SQL script from URL [file:/Users/somkiat/data  
ms.
```

Run service

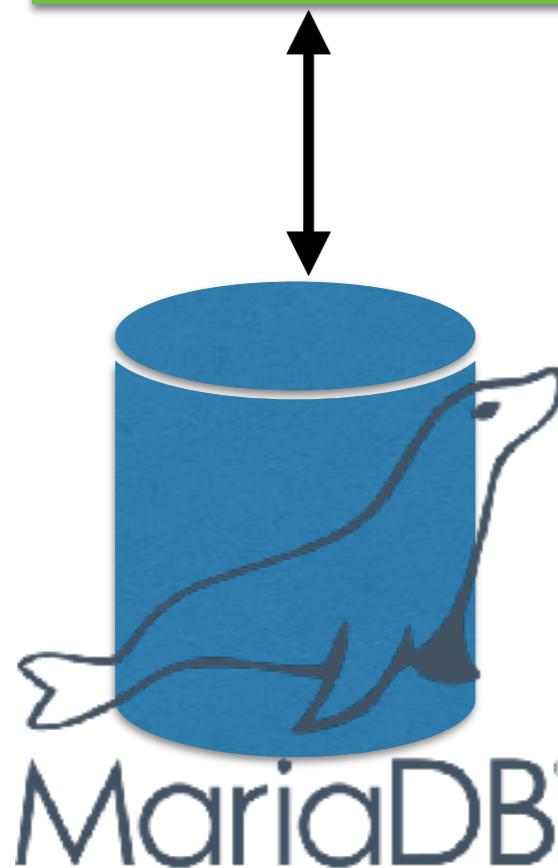

http://localhost:8080/account/0868696209

```
← → ⌂ ⓘ localhost:8080/account/0868696209
[
  - {
    accountNo: "01",
    mobileNo: null,
    name: "",
    accountType: ""
  },
  - {
    accountNo: "02",
    mobileNo: null,
    name: "",
    accountType: ""
  }
]
```

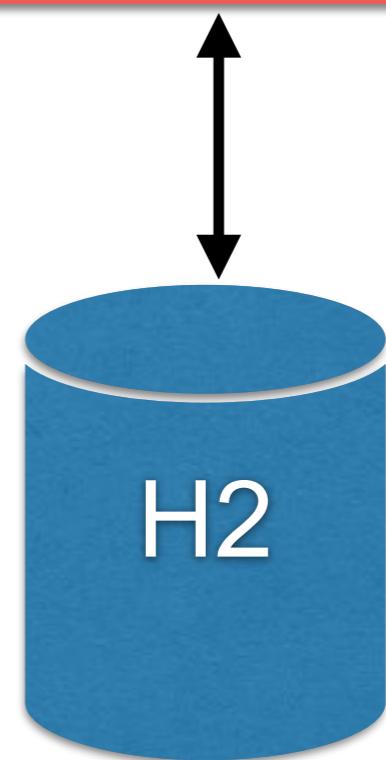

Working with Database

Production

Testing

Add database dependency

In file pom.xml

```
<dependency>
    <groupId>org.mariadb.jdbc</groupId>
    <artifactId>mariadb-java-client</artifactId>
    <version>2.2.5</version>
</dependency>
```

<https://mariadb.com/kb/en/library/about-mariadb-connector-j/>

Config database in application

In file resources/application.yml

```
spring:
  datasource:
    driver-class-name: org.mariadb.jdbc.Driver
    url: jdbc:mariadb://35.198.254.195:3306/account
    username: user01
    password: password

    initialization-mode: always
    testWhileIdle: true
    validationQuery: SELECT 1

  jpa:
    show-sql: true
    properties:
      hibernate:
        dialect: org.hibernate.dialect.MySQL5InnoDBDialect
```

Config database in application

Required config for database

```
spring:
```

```
  datasource:  
    driver-class-name: org.mariadb.jdbc.Driver  
    url: jdbc:mariadb://35.198.254.195:3306/account  
    username: user01  
    password: password
```

```
    initialization-mode: always
```

```
    testWhileIdle: true
```

```
    validationQuery: SELECT 1
```

```
jpa:
```

```
  show-sql: true
```

```
  properties:
```

```
    hibernate:
```

```
      dialect: org.hibernate.dialect.MySQL5InnoDBDialect
```

Config database in application

Required config for database

```
spring:  
  datasource:  
    driver-class-name: org.mariadb.jdbc.Driver  
    url: jdbc:mariadb://35.198.254.195:3306/account  
    username: user01  
    password: password
```

```
  initialization-mode: always
```

```
  testWhileIdle: true  
  validationQuery: SELECT 1  
  
  jpa:  
    show-sql: true  
    properties:  
      hibernate:  
        dialect: org.hibernate.dialect.MySQL5InnoDBDialect
```

By default not run

Run service

http://localhost:8080/account/0868696209

```
[  
  - {  
      accountNo: "01",  
      mobileNo: null,  
      name: "",  
      accountType: ""  
    },  
  - {  
      accountNo: "02",  
      mobileNo: null,  
      name: "",  
      accountType: ""  
    }  
]
```

Check your test ?

\$mvnw clean test

Step to test

Stop the real database before run test

See result

Error ?

Spring boot try to connect to the real database ?

Fix Error

Create file /resources/application.yml in test folder

spring: **config of H2 database**

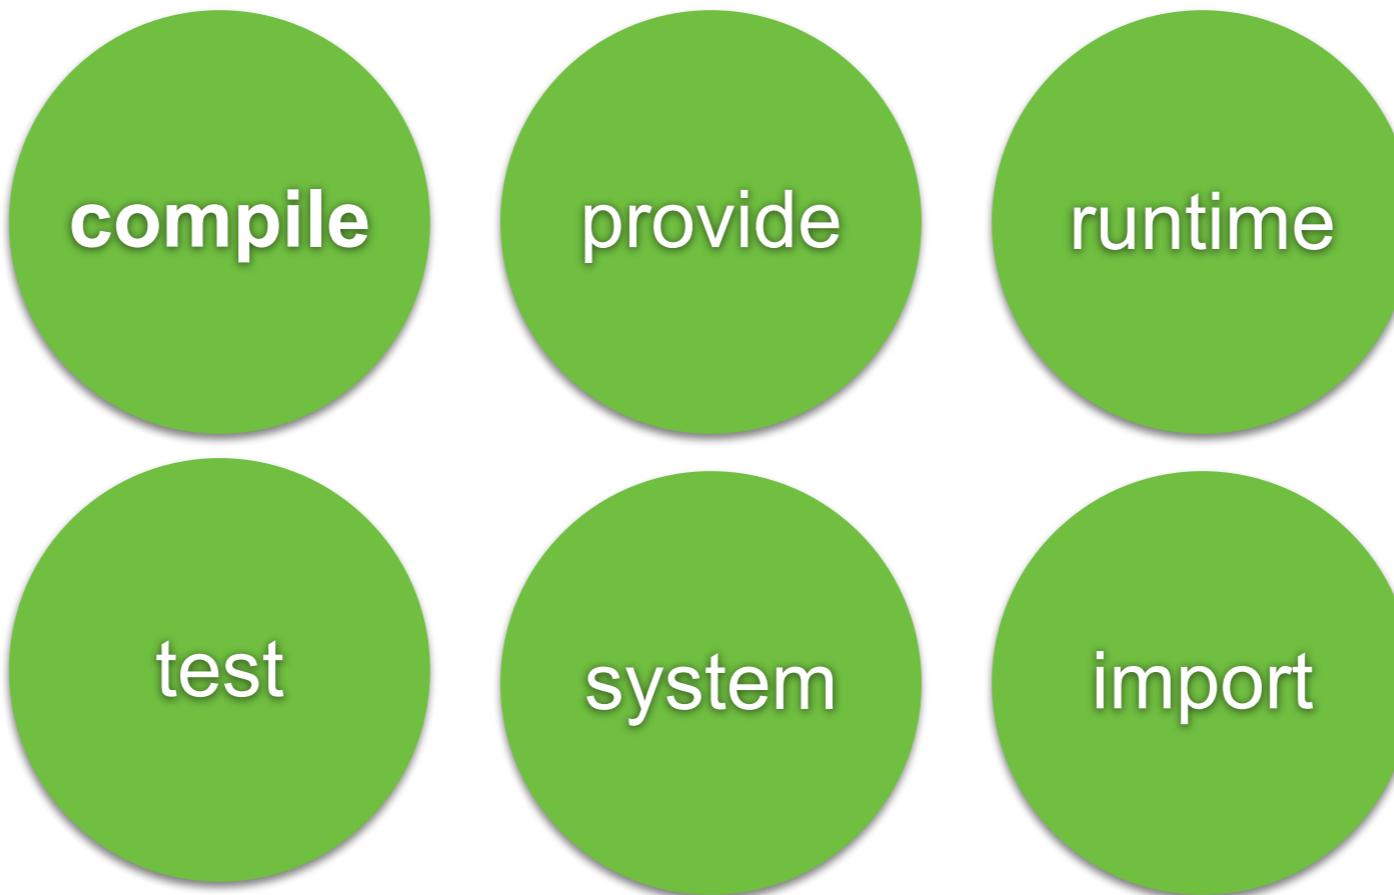

```
datasource:  
  driver-class-name: org.h2.Driver  
  url: jdbc:h2:mem:db;DB_CLOSE_DELAY=-1  
  username: sa  
  password: sa
```

```
jpa:  
  show-sql: true  
  properties:  
    hibernate:  
      dialect: org.hibernate.dialect.H2Dialect
```

Question ?

Dependency Scopes in file pom.xml
runtime ?

https://maven.apache.org/guides/introduction/introduction-to-dependency-mechanism.html#Dependency_Scope

Question ?

show_sql=true not working ?

```
jpa:  
  show_sql: true  
  hibernate:  
    ddl-auto: none  
  properties:  
    hibernate:  
      format_sql: true  
    dialect: org.hibernate.dialect.MySQL5InnoDBDialect
```

```
logging:  
  level:  
    org.hibernate.SQL: DEBUG
```

Beautiful sql format

Default log level = INFO

<http://www.baeldung.com/sql-logging-spring-boot>

Result of logging message

```

Testing with Mocking

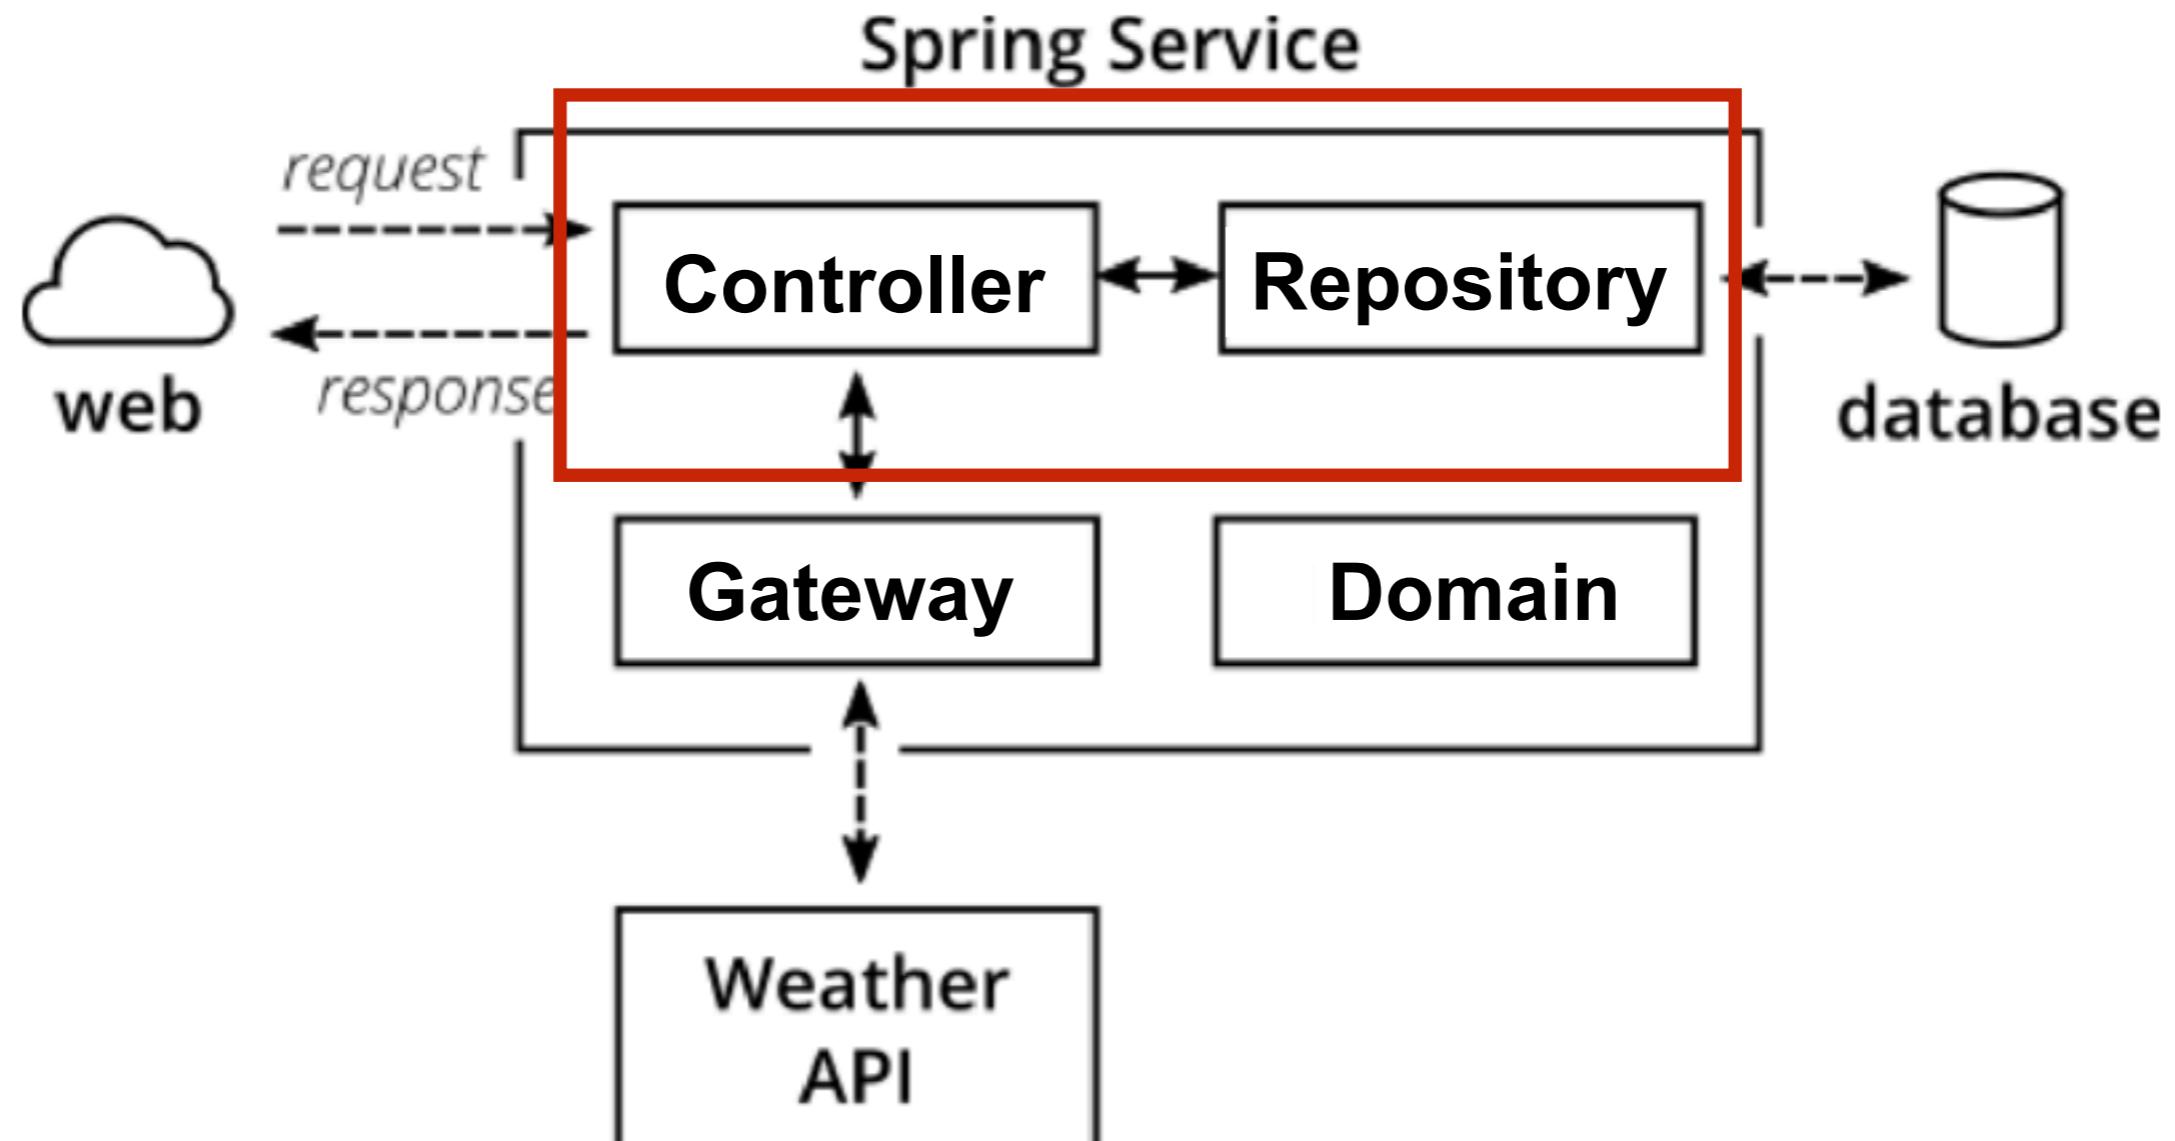

Controller/Service Testing

Unit testing ?

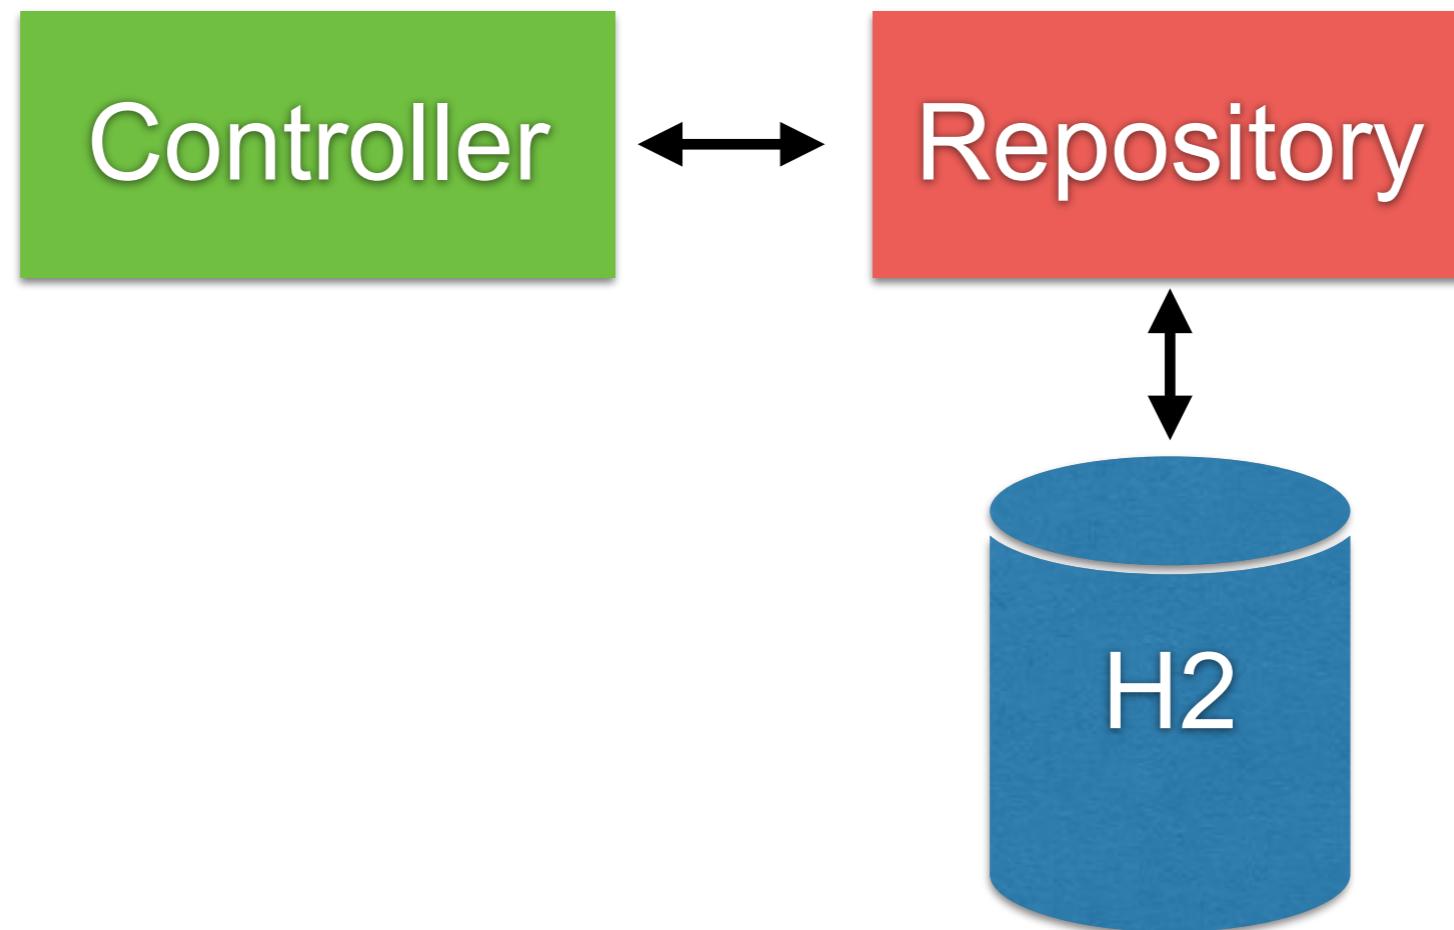

Spring Unit testing with MockMvc ?

Controller Testing with Unit test

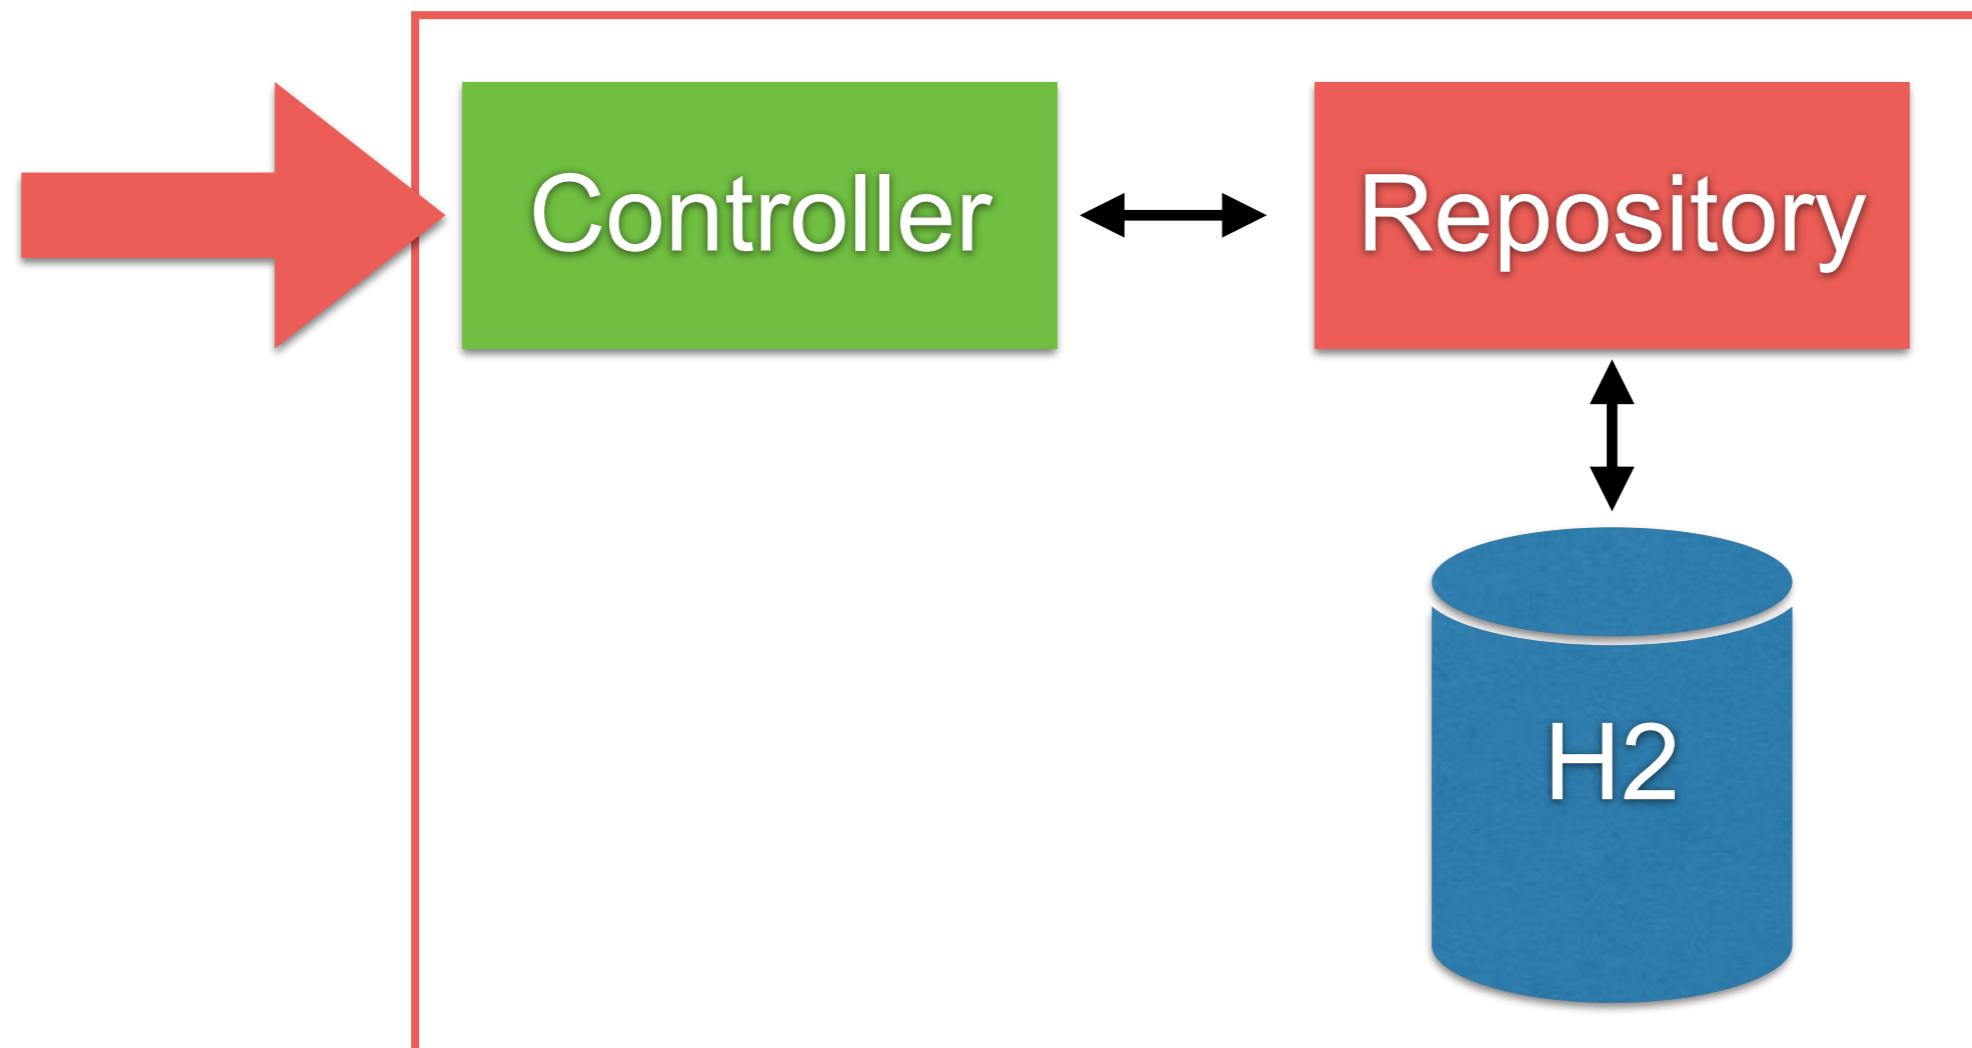

Controller Testing

Controller Testing

Using `@SpringBootTest`

Spring Testing

Unit test

Use Test Double

In java, use Mockito library

<http://site.mockito.org/>

Unit test with Mockito (1)

```
public class HelloControllerWithRepositoryTest {  
    private HelloControllerWithRepository controllerWithRepository;  
  
    @Mock  
    private PersonRepository personRepository;  
  
    @Before  
    public void init() {  
        initMocks(testClass: this);  
        controllerWithRepository  
            = new HelloControllerWithRepository(personRepository);  
    }  
}
```

Unit test with Mockito (2)

```
@Test
public void shouldReturnHelloSomkiat() {
    //Arrange
    Person somkiat = new Person("somkiat", "pui");
    given(personRepository.findByName("somkiat"))
        .willReturn(Optional.of(somkiat));

    // Action
    Hello hello = controllerWithRepository.sayHi( name: "somkiat");

    // Assert
    assertEquals( expected: "Hello somkiat", hello.getMessage());
}
```

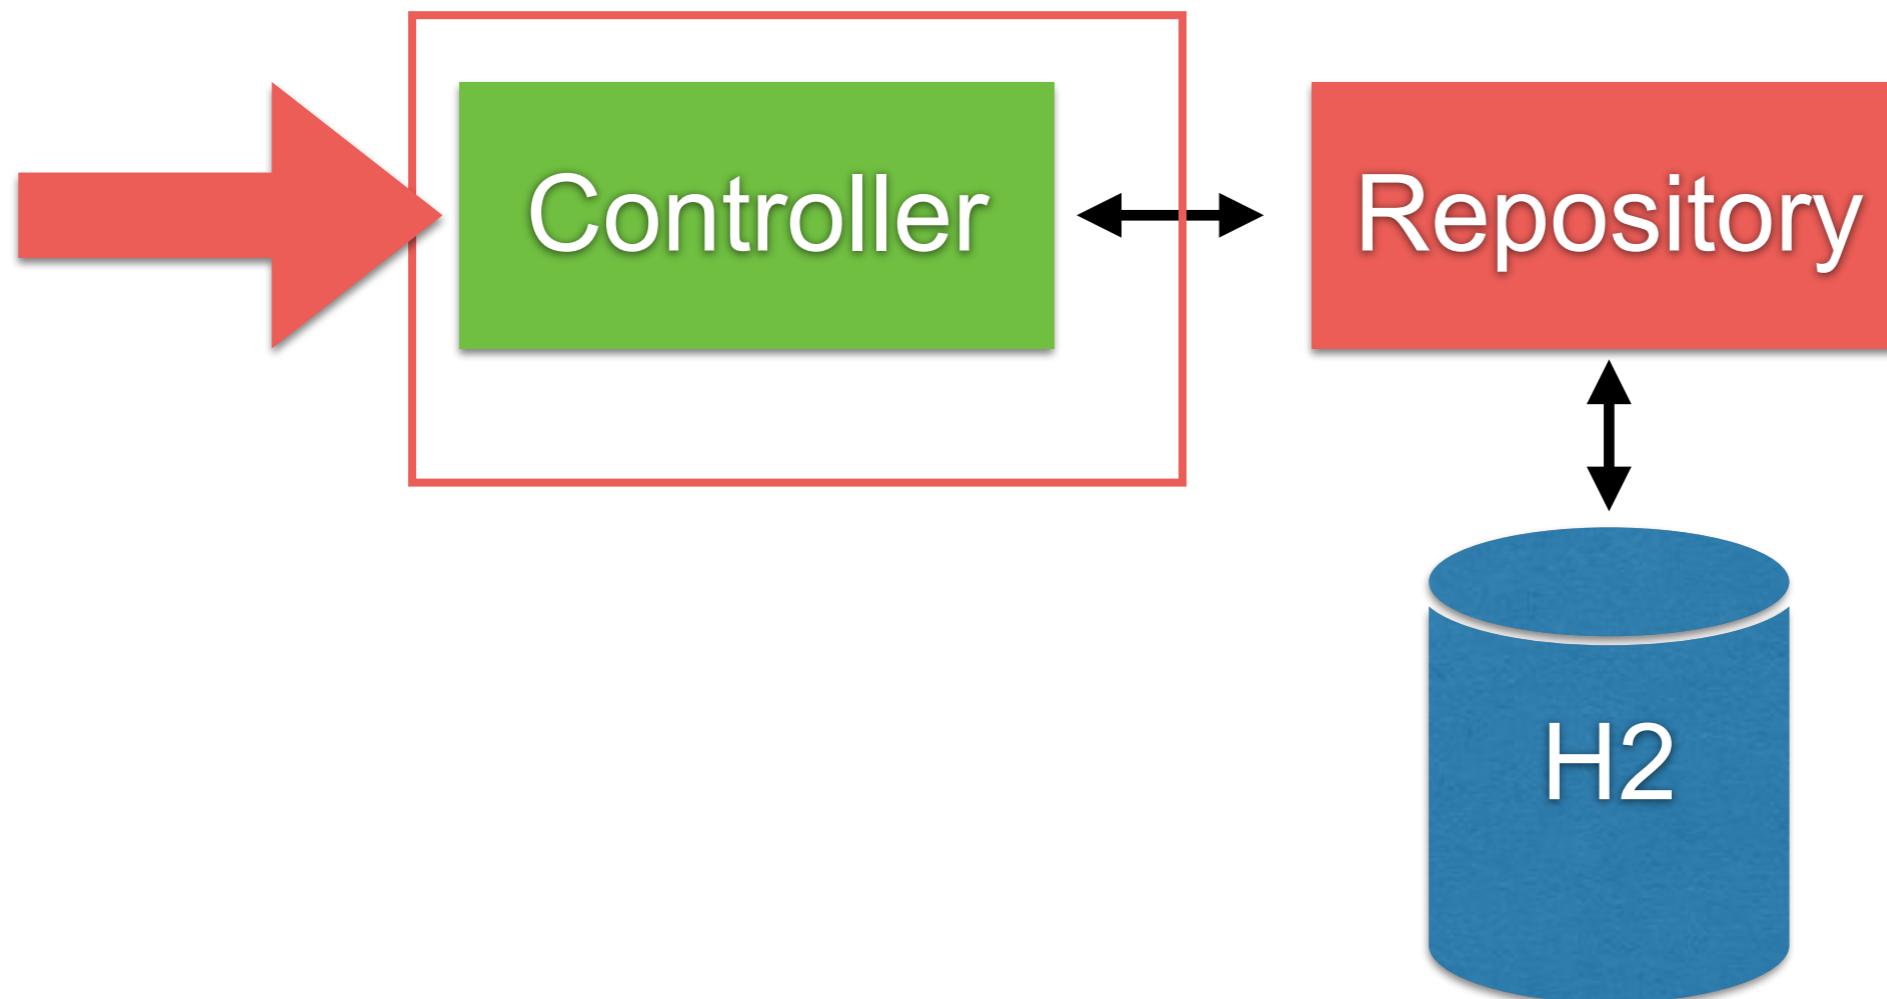

Try by yourself

Controller Testing with mock

Using `@SpringBootTest`

Spring Testing

Controller Testing with mock (1)

```
@RunWith(SpringRunner.class)
@SpringBootTest(
    webEnvironment = WebEnvironment.RANDOM_PORT)
public class AccountControllerMockTest {

    @Autowired
    private TestRestTemplate testRestTemplate;

    @MockBean
    private AccountRepository accountRepository;
```

Controller Testing with mock (2)

```
@Test  
public void เรียกข้อมูลบัญชีของหมายเลข_0868696209_ต้องเจอสองบัญชีนั่น()  
{  
    // Arrange  
    List<Account> accountIterable = new ArrayList<>();  
    accountIterable.add(new Account("01"));  
    accountIterable.add(new Account("02"));  
    given(accountRepository.findAll()).willReturn(accountIterable);  
  
    // Act  
    List<AccountResponse> accountResponses  
        = testRestTemplate.getForObject(  
            "/account/0868696209", List.class);  
  
    // Assert  
    assertEquals(2, accountResponses.size());  
}
```

Controller Testing with mock (3)

```
@Test
public void
    เรียกข้อมูลบัญชีของหมายเลข_0868696209_ต้องเจอสองบัญชีนั่น() {
        // Arrange
        List<Account> accountIterable = new ArrayList<>();
        accountIterable.add(new Account("01"));
        accountIterable.add(new Account("02"));
        given(accountRepository.findAll()).willReturn(accountIterable);

        // Act
        List<AccountResponse> accountResponses
            = testRestTemplate.getForObject(
                "/account/0868696209", List.class);

        // Assert
        assertEquals(2, accountResponses.size());
    }
```

Call service with rest template
